# tagpdf – A package to experiment with pdf tagging*

Ulrike Fischer†

Released 2022-08-24

## Contents

**1 Initialization and test if pdfmanagement is active. 7**

**2 Package options 7**

**3 Packages 8**
3.1 a LastPage label . . . . . 8

**4 Variables 9**

**5 Variants of l3 commands 10**

**6 Setup label attributes 11**

**7 Label commands 11**

**8 Commands to fill seq and prop 12**

**9 General tagging commands 12**

**10 Keys for tagpdfsetup 13**

**11 loading of engine/more dependent code 14**

**I The tagpdf-checks module Messages and check code Part of the tagpdf package 16**

**1 Commands 16**

*This file describes v0.97, last revised 2022-08-24.

†E-mail: fischer@troubleshooting-tex.de

**2 Description of log messages** **16**
2.1 \ShowTagging command . . . . . 16
2.2 Messages in checks and commands . . . . . 16
2.3 Messages from the ptagging code . . . . . 17
2.4 Warning messages from the lua-code . . . . . 17
2.5 Info messages from the lua-code . . . . . 17
2.6 Debug mode messages and code . . . . . 18
2.7 Messages . . . . . 18

**3 Messages** **19**
3.1 Messages related to mc-chunks . . . . . 19
3.2 Messages related to structures . . . . . 20
3.3 Attributes . . . . . 21
3.4 Roles . . . . . 21
3.5 Miscellaneous . . . . . 22

**4 Retrieving data** **22**

**5 User conditionals** **23**

**6 Internal checks** **23**
6.1 checks for active tagging . . . . . 23
6.2 Checks related to structures . . . . . 24
6.3 Checks related to roles . . . . . 25
6.4 Check related to mc-chunks . . . . . 26
6.5 Checks related to the state of MC on a page or in a split stream . . . . 28

**II The tagpdf-user module**
**Code related to LaTeX2e user commands and document commands**
**Part of the tagpdf package** **32**

**1 Setup commands** **32**

**2 Commands related to mc-chunks** **32**

**3 Commands related to structures** **33**

**4 Debugging** **33**

**5 Extension commands** **33**
5.1 Fake space . . . . . 34
5.2 Paratagging . . . . . 34
5.3 Header and footer . . . . . 34
5.4 Link tagging . . . . . 35

**6 User commands and extensions of document commands** **35**

**7 Setup and preamble commands** **35**

**8 Commands for the mc-chunks** **35**

**9 Commands for the structure** **36**

**10 Debugging** **36**

**11 Commands to extend document commands** **39**
11.1 Document structure . . . . . 39
11.2 Structure destinations . . . . . 40
11.3 Fake space . . . . . 40
11.4 Paratagging . . . . . 41
11.5 Header and footer . . . . . 43
11.6 Links . . . . . 45

**III The tagpdf-tree module**
**Commands trees and main dictionaries**
**Part of the tagpdf package** **47**

**1 Trees, pdfmanagement and finalization code** **47**
1.1 Check structure . . . . . 47
1.2 Catalog: MarkInfo and StructTreeRoot . . . . . 48
1.3 Writing structure elements . . . . . 48
1.4 ParentTree . . . . . 49
1.5 Rolemap dictionary . . . . . 51
1.6 Classmap dictionary . . . . . 52
1.7 Namespaces . . . . . 53
1.8 Finishing the structure . . . . . 54
1.9 StructParents entry for Page . . . . . 54

**IV The tagpdf-mc-shared module**
**Code related to Marked Content (mc-chunks), code shared by all modes**
**Part of the tagpdf package** **55**

**1 Public Commands** **55**

**2 Public keys** **56**

**3 Marked content code – shared** **56**
3.1 Variables and counters . . . . . 57
3.2 Functions . . . . . 58
3.3 Keys . . . . . 60

**V The tagpdf-mc-generic module**
**Code related to Marked Content (mc-chunks), generic mode**
**Part of the tagpdf package** **62**

1 Marked content code – generic mode 62
1.1 Variables . . . 62
1.2 Functions . . . 63
1.3 Looking at MC marks in boxes . . . 66
1.4 Keys . . . 73

VI The tagpdf-mc-luacode module
Code related to Marked Content (mc-chunks), luamode-specific
Part of the tagpdf package 75

1 Marked content code – luamode code 75
1.1 Commands . . . 76
1.2 Key definitions . . . 80

VII The tagpdf-struct module
Commands to create the structure
Part of the tagpdf package 83

1 Public Commands 83

2 Public keys 84
2.1 Keys for the structure commands . . . 84
2.2 Setup keys . . . 86

3 Variables 86
3.1 Variables used by the keys . . . 88
3.2 Variables used by tagging code of basic elements . . . 89

4 Commands 89
4.1 Initialization of the StructTreeRoot . . . 90
4.2 Filling in the tag info . . . 90
4.3 Handlings kids . . . 91
4.4 Output of the object . . . 94

5 Keys 97

6 User commands 102

7 Attributes and attribute classes 107
7.1 Variables . . . 107
7.2 Commands and keys . . . 107

VIII The tagpdf-luatex.def
Driver for luatex
Part of the tagpdf package 110

1 Loading the lua 110

2 Logging functions 114

**3 Helper functions 116**
3.1 Retrieve data functions . . . 116
3.2 Functions to insert the pdf literals . . . 118

**4 Function for the real space chars 119**

**5 Function for the tagging 122**

**6 Parenttree 127**

**IX The tagpdf-roles module
Tags, roles and namesspace code
Part of the tagpdf package 129**

**1 Code related to roles and structure names 129**
1.1 Variables . . . 129
1.2 Namespaces . . . 132
1.3 Adding a new tag . . . 133
1.3.1 pdf 1.7 and earlier . . . 134
1.3.2 The pdf 2.0 version . . . 135
1.4 Helper command to read the data from files . . . 136
1.5 Reading the default data . . . 138
1.6 Parent-child rules . . . 139
1.6.1 Reading in the csv-files . . . 139
1.6.2 Retrieving the parent-child rule . . . 141
1.7 Remapping of tags . . . 146
1.8 Key-val user interface . . . 147

**X The tagpdf-space module
Code related to real space chars
Part of the tagpdf package 149**

**1 Code for interword spaces 149**

**Index 152**

`\ref_value:nnn` `\ref_value:nnn{⟨label⟩}{⟨attribute⟩}{⟨fallback default⟩}`

This is a temporary definition which will have to move to l3ref. It allows to locally set a default value if the label or the attribute doesn't exist. See issue #4 in Accessible-xref.

`\tag_stop_group_begin:`
`\tag_stop_group_end:`
`\tag_stop:`
`\tag_start:`
`\tag_stop:n`
`\tag_start:n`

We need commands to stop tagging in some places. There simply switches the two local booleans. The grouping commands can be used to group the effect.

`\tag_stop:n` `\tag_stop:n{⟨label⟩}`
`\tag_start:n` `\tag_start:n{⟨label⟩}`

This commands are intended as a pair. The start command will only restart tagging if the previous stop command with the same label actually stopped tagging.

`activate-space␣(setup-key)`

`activate-space` activates the additional parsing needed for interword spaces. It is not documented, the parsing is currently implicitly activated by the known key `interwordspace`, as the code will perhaps move to some other place, now that it is better separated.

`activate-mc␣(setup-key)`
`activate-tree␣(setup-key)`
`activate-struct␣(setup-key)`
`activate-all␣(setup-key)`

Keys to activate the various tagging steps

`no-struct-dest␣(setup-key)`

The key allows to suppress the creation of structure destinations

`log␣(setup-key)`

The `log` takes currently the values `none`, `v`, `vv`, `vvv`, `all`. More details are in `tagpdf-checks`.

`tagunmarked␣(setup-key)`

This key allows to set if (in luamode) unmarked text should be marked up as artifact. The initial value is true.

`tabsorder␣(setup-key)`

This sets the tabsorder on a page. The values are `row`, `column`, `structure` (default) or `none`. Currently this is set more or less globally. More finer control can be added if needed.

`tagstruct`
`tagstructobj`
`tagabspage`
`tagmcabs`
`tagmcid`

These are attributes used by the label/ref system.

# 1 Initialization and test if pdfmanagement is active.

```
⟨@@=tag⟩
⟨*package⟩
\ProvidesExplPackage {tagpdf} {2022-08-24} {0.97}
  { A package to experiment with pdf tagging }

\bool_if:nF
  {
    \bool_lazy_and_p:nn
      {\cs_if_exist_p:N \pdfmanagement_if_active_p:}
      { \pdfmanagement_if_active_p: }
  }
  {  %error for now, perhaps warning later.
    \PackageError{tagpdf}
     {
       PDF~resource~management~is~no~active!\MessageBreak
       tagpdf~will~no~work.
     }
     {
       Activate~it~with \MessageBreak
       \string\RequirePackage{pdfmanagement-testphase}\MessageBreak
       \string\DocumentMetadata{<options>}\MessageBreak
       before~\string\documentclass
     }
  }
⟨/package⟩
```

<*debug>

```
\ProvidesExplPackage {tagpdf-debug} {2022-08-24} {0.97}
  { debug code for tagpdf }
\@ifpackageloaded{tagpdf}{}{\PackageWarning{tagpdf-debug}{tagpdf~not~loaded,~quitting}\endinpu
```

</debug> We map the internal module name “tag” to “tagpdf” in messages.

```
⟨*package⟩
\prop_gput:Nnn \g_msg_module_name_prop { tag }{ tagpdf }
⟨/package⟩
```

Debug mode has its special mapping:

```
⟨*debug⟩
\prop_gput:Nnn \g_msg_module_type_prop { tag / debug} {}
\prop_gput:Nnn \g_msg_module_name_prop { tag / debug }{tagpdf~DEBUG}
⟨/debug⟩
```

# 2 Package options

There are only two options to switch for luatex between generic and luamode, TODO try to get rid of them.

```
⟨*package⟩
\bool_new:N\g__tag_mode_lua_bool
\DeclareOption {luamode}    { \sys_if_engine_luatex:T { \bool_gset_true:N \g__tag_mode_lua_boo
\DeclareOption {genericmode}{ \bool_gset_false:N\g__tag_mode_lua_bool }
\ExecuteOptions{luamode}
\ProcessOptions
```

# 3 Packages

We need the temporary version of l3ref until this is in the kernel.

```
\RequirePackage{l3ref-tmp}
```

To be on the safe side for now, load also the base definitions

```
\RequirePackage{tagpdf-base}
⟨/package⟩
```

```
⟨*base⟩
\ProvidesExplPackage {tagpdf-base} {2022-08-24} {0.97}
  {part of tagpdf - provide base, no-op versions of the user commands }
⟨/base⟩
```

The no-op version should behave a near enough to the real code as possible, so we define a command which a special in the relevant backends:

```
⟨*base⟩
\AddToHook{begindocument}
 {
  \str_case:VnF \c_sys_backend_str
   {
    { luatex  } { \cs_new_protected:Npn \__tag_whatsits: {} }
    { dvisvgm } { \cs_new_protected:Npn \__tag_whatsits: {} }
   }
   {
     \cs_new_protected:Npn \__tag_whatsits: {\tex_special:D {} }
   }
 }
⟨/base⟩
```

## 3.1 a LastPage label

See also issue #2 in Accessible-xref

__tag_lastpagelabel:

```
⟨*package⟩
 \cs_new_protected:Npn \__tag_lastpagelabel:
   {
     \legacy_if:nT { @filesw }
       {
         \exp_args:NNnx \exp_args:NNx\iow_now:Nn \@auxout
            {
              \token_to_str:N \newlabeldata
                {__tag_LastPage}
                {
                  {abspage} { \int_use:N \g_shipout_readonly_int}
                  {tagmcabs}{ \int_use:N \c@g__tag_MCID_abs_int }
                }
            }
       }
   }

 \AddToHook{enddocument/afterlastpage}
  {\__tag_lastpagelabel:}
```

(*End definition for* `\__tag_lastpagelabel:`.)

`\ref_value:nnn` This allows to locally set a default value if the label or the attribute doesn't exist.

```
\cs_if_exist:NF \ref_value:nnn
  {
    \cs_new:Npn \ref_value:nnn #1#2#3
      {
        \exp_args:Nee
          \__ref_value:nnn
           { \tl_to_str:n {#1} } { \tl_to_str:n {#2} } {#3}
      }
    \cs_new:Npn \__ref_value:nnn #1#2#3
      {
        \tl_if_exist:cTF { g__ref_label_ #1 _ #2 _tl }
          { \tl_use:c { g__ref_label_ #1 _ #2 _tl } }
          {
            #3
          }
      }
  }
```

(*End definition for* `\ref_value:nnn`. *This function is documented on page* 6.)

# 4 Variables

`\l__tag_tmpa_tl` A few temporary variables
`\l__tag_tmpb_tl`
`\l__tag_get_tmpc_tl`
`\l__tag_get_parent_tmpa_tl`
`\l__tag_get_parent_tmpb_tl`
`\l__tag_tmpa_str`
`\l__tag_tmpa_prop`
`\l__tag_tmpa_seq`
`\l__tag_tmpb_seq`
`\l__tag_tmpa_clist`
`\l__tag_tmpa_int`
`\l__tag_tmpa_box`
`\l__tag_tmpb_box`

```
\tl_new:N    \l__tag_tmpa_tl
\tl_new:N    \l__tag_tmpb_tl
\tl_new:N    \l__tag_get_tmpc_tl
\tl_new:N    \l__tag_get_parent_tmpa_tl
\tl_new:N    \l__tag_get_parent_tmpb_tl
\str_new:N   \l__tag_tmpa_str
\prop_new:N  \l__tag_tmpa_prop
\seq_new:N   \l__tag_tmpa_seq
\seq_new:N   \l__tag_tmpb_seq
\clist_new:N \l__tag_tmpa_clist
\int_new:N   \l__tag_tmpa_int
\box_new:N   \l__tag_tmpa_box
\box_new:N   \l__tag_tmpb_box
```

(*End definition for* `\l__tag_tmpa_tl` *and others.*)

Attribute lists for the label command. We have a list for mc-related labels, and one for structures.

`\c__tag_refmc_clist`
`\c__tag_refstruct_clist`

```
\clist_const:Nn \c__tag_refmc_clist     {tagabspage,tagmcabs,tagmcid}
\clist_const:Nn \c__tag_refstruct_clist {tagstruct,tagstructobj}
```

(*End definition for* `\c__tag_refmc_clist` *and* `\c__tag_refstruct_clist`.)

`\l__tag_loglevel_int` This integer hold the log-level and so allows to control the messages. TODO: a list which log-level shows what is needed. The current behaviour is quite ad-hoc.

```
\int_new:N  \l__tag_loglevel_int
```

(*End definition for* `\l__tag_loglevel_int`.)

`\g__tag_active_space_bool` `\g__tag_active_mc_bool` `\g__tag_active_tree_bool` `\g__tag_active_struct_bool` `\g__tag_active_struct_dest_bool`

These booleans should help to control the global behaviour of tagpdf. Ideally it should more or less do nothing if all are false. The space-boolean controles the interword space code, the mc-boolean activates `\tag_mc_begin:n`, the tree-boolean activates writing the finish code and the pdfmanagement related commands, the struct-boolean activates the storing of the structure data. In a normal document all should be active, the split is only there for debugging purpose. Structure destination will be activated automatically if pdf version 2.0 is detected, but with the boolean struct-dest-boolean one can suppress them. Also we assume currently that they are set only at begin document. But if some control passing over groups are needed they could be perhaps used in a document too. TODO: check if they are used everywhere as needed and as wanted.

```
\bool_new:N \g__tag_active_space_bool
\bool_new:N \g__tag_active_mc_bool
\bool_new:N \g__tag_active_tree_bool
\bool_new:N \g__tag_active_struct_bool
\bool_new:N \g__tag_active_struct_dest_bool
\bool_gset_true:N \g__tag_active_struct_dest_bool
```

(*End definition for* `\g__tag_active_space_bool` *and others.*)

`\l__tag_active_mc_bool` `\l__tag_active_struct_bool`

These booleans should help to control the *local* behaviour of tagpdf. In some cases it could e.g. be necessary to stop tagging completely. As local booleans they respect groups. TODO: check if they are used everywhere as needed and as wanted.

```
\bool_new:N \l__tag_active_mc_bool
\bool_set_true:N \l__tag_active_mc_bool
\bool_new:N \l__tag_active_struct_bool
\bool_set_true:N \l__tag_active_struct_bool
```

(*End definition for* `\l__tag_active_mc_bool` *and* `\l__tag_active_struct_bool`.)

`\g__tag_tagunmarked_bool`

This boolean controls if the code should try to automatically tag parts not in mc-chunk. It is currently only used in luamode. It would be possible to used it in generic mode, but this would create quite a lot empty artifact mc-chunks.

```
\bool_new:N \g__tag_tagunmarked_bool
```

(*End definition for* `\g__tag_tagunmarked_bool`.)

# 5 Variants of l3 commands

```
\prg_generate_conditional_variant:Nnn \pdf_object_if_exist:n {e}{T,F}
\cs_generate_variant:Nn \pdf_object_ref:n {e}
\cs_generate_variant:Nn \pdfannot_dict_put:nnn {nnx}
\cs_generate_variant:Nn \pdffile_embed_stream:nnn {nxx,oxx}
\cs_generate_variant:Nn \prop_gput:Nnn {Nxx,Nen}
\cs_generate_variant:Nn \prop_put:Nnn  {Nxx}
\cs_generate_variant:Nn \prop_item:Nn {No,Ne}
\cs_generate_variant:Nn \ref_label:nn { nv }
\cs_generate_variant:Nn \seq_set_split:Nnn{Nne}
\cs_generate_variant:Nn \str_set_convert:Nnnn {Nonn, Noon, Nnon }
\cs_generate_variant:Nn \clist_map_inline:nn {on}
```

# 6 Setup label attributes

tagstruct
tagstructobj
tagabspage
tagmcabs
tagmcid

This are attributes used by the label/ref system. With structures we store the structure number `tagstruct` and the object reference `tagstructobj`. The second is needed to be able to reference a structure which hasn't been created yet. The alternative would be to create the object in such cases, but then we would have to check the object existence all the time.

With mc-chunks we store the absolute page number `tagabspage`, the absolute id `tagmcabc`, and the id on the page `tagmcid`.

```
\ref_attribute_gset:nnnn { tagstruct } {0} { now }
  { \int_use:N \c@g__tag_struct_abs_int }
\ref_attribute_gset:nnnn { tagstructobj } {} { now }
  {
    \pdf_object_if_exist:eT {__tag/struct/\int_use:N \c@g__tag_struct_abs_int}
      {
        \pdf_object_ref:e{__tag/struct/\int_use:N \c@g__tag_struct_abs_int}
      }
  }
\ref_attribute_gset:nnnn { tagabspage } {0} { shipout }
  { \int_use:N \g_shipout_readonly_int }
\ref_attribute_gset:nnnn { tagmcabs } {0} { now }
  { \int_use:N \c@g__tag_MCID_abs_int }
\ref_attribute_gset:nnnn {tagmcid }  {0} { now }
  { \int_use:N \g__tag_MCID_tmp_bypage_int }
```

(*End definition for* `tagstruct` *and others. These functions are documented on page 6.*)

# 7 Label commands

__tag_ref_label:nn

A version of `\ref_label:nn` to set a label which takes a keyword `mc` or `struct` to call the relevant lists. TODO: check if `\@bsphack` and `\@esphack` make sense here.

```
\cs_new_protected:Npn \__tag_ref_label:nn #1 #2 %#1 label, #2 name of list mc or struct
  {
    \@bsphack
    \ref_label:nv {#1}{c__tag_ref#2_clist}
    \@esphack
  }
\cs_generate_variant:Nn \__tag_ref_label:nn {en}
```

(*End definition for* `\__tag_ref_label:nn`.)

__tag_ref_value:nnn

A local version to retrieve the value. It is a direct wrapper, but to keep naming consistent .... It uses the variant defined temporarly above.

```
\cs_new:Npn \__tag_ref_value:nnn #1 #2 #3 %#1 label, #2 attribute, #3 default
  {
    \ref_value:nnn {#1}{#2}{#3}
  }
\cs_generate_variant:Nn \__tag_ref_value:nnn {enn}
```

(*End definition for* `\__tag_ref_value:nnn`.)

__tag_ref_value_lastpage:nn A command to retrieve the lastpage label, this will be adapted when there is a proper, kernel lastpage label.

```
\cs_new:Npn \__tag_ref_value_lastpage:nn #1 #2
  {
    \ref_value:nnn {__tag_LastPage}{#1}{#2}
  }
```

(*End definition for* `\__tag_ref_value_lastpage:nn`.)

# 8 Commands to fill seq and prop

With most engines these are simply copies of the expl3 commands, but luatex will overwrite them, to store the data also in lua tables.

__tag_prop_new:N
__tag_seq_new:N
__tag_prop_gput:Nnn
__tag_seq_gput_right:Nn
__tag_seq_item:cn
__tag_prop_item:cn
__tag_seq_show:N
__tag_prop_show:N

```
\cs_set_eq:NN \__tag_prop_new:N        \prop_new:N
\cs_set_eq:NN \__tag_seq_new:N         \seq_new:N
\cs_set_eq:NN \__tag_prop_gput:Nnn     \prop_gput:Nnn
\cs_set_eq:NN \__tag_seq_gput_right:Nn \seq_gput_right:Nn
\cs_set_eq:NN \__tag_seq_item:cn       \seq_item:cn
\cs_set_eq:NN \__tag_prop_item:cn      \prop_item:cn
\cs_set_eq:NN \__tag_seq_show:N        \seq_show:N
\cs_set_eq:NN \__tag_prop_show:N       \prop_show:N

\cs_generate_variant:Nn \__tag_prop_gput:Nnn      { Nxn , Nxx, Nnx , cnn, cxn, cnx, cno}
\cs_generate_variant:Nn \__tag_seq_gput_right:Nn  { Nx  , No, cn, cx }
\cs_generate_variant:Nn \__tag_prop_new:N   { c }
\cs_generate_variant:Nn \__tag_seq_new:N    { c }
\cs_generate_variant:Nn \__tag_seq_show:N   { c }
\cs_generate_variant:Nn \__tag_prop_show:N  { c }
```

(*End definition for* `\__tag_prop_new:N` *and others.*)

# 9 General tagging commands

\tag_stop_group_begin:
\tag_stop_group_end:
\tag_stop:
\tag_start:
\tag_stop:n
\tag_start:n

We need commands to stop tagging in some places. This simply switches the two local booleans. In some cases tagging should only restart, if it actually was stopped before. For this it is possible to label a stop.

```
\cs_new_protected:Npn \tag_stop_group_begin:
  {
    \group_begin:
    \bool_set_false:N \l__tag_active_struct_bool
    \bool_set_false:N \l__tag_active_mc_bool
  }
\cs_set_eq:NN \tag_stop_group_end: \group_end:
\cs_set_protected:Npn \tag_stop:
  {
    \bool_set_false:N \l__tag_active_struct_bool
    \bool_set_false:N \l__tag_active_mc_bool
  }
\cs_set_protected:Npn \tag_start:
  {
```

```

(*End definition for* `\tag_stop_group_begin:` *and others. These functions are documented on page 6.*)

# 10 Keys for tagpdfsetup

TODO: the log-levels must be sorted

`activate-space␣(setup-key)`
`activate-mc␣(setup-key)`
`activate-tree␣(setup-key)`
`activate-struct␣(setup-key)`
`activate-all␣(setup-key)`
`no-struct-dest␣(setup-key)`

Keys to (globally) activate tagging. `activate-space` activates the additional parsing needed for interword spaces. It is not documented, the parsing is currently implicitly activated by the known key `interwordspace`, as the code will perhaps move to some other place, now that it is better separated. `no-struct-dest` allows to suppress structure destinations.

```
⟨*package⟩
\keys_define:nn { __tag / setup }
  {
    activate-space  .bool_gset:N = \g__tag_active_space_bool,
    activate-mc     .bool_gset:N = \g__tag_active_mc_bool,
    activate-tree   .bool_gset:N = \g__tag_active_tree_bool,
    activate-struct .bool_gset:N = \g__tag_active_struct_bool,
    activate-all    .meta:n =
      {activate-mc={#1},activate-tree={#1},activate-struct={#1}},
```

```
    activate-all  .default:n = true,
    no-struct-dest .bool_gset_inverse:N = \g__tag_active_struct_dest_bool,

```

(*End definition for* `activate-space (setup-key)` *and others. These functions are documented on page 6.*)

`log␣(setup-key)` The `log` takes currently the values `none`, `v`, `vv`, `vvv`, `all`. The description of the log levels is in tagpdf-checks.

```
    log             .choice:,
    log / none      .code:n = {\int_set:Nn \l__tag_loglevel_int { 0 }},
    log / v         .code:n =
      {
        \int_set:Nn \l__tag_loglevel_int { 1 }
        \cs_set_protected:Nn \__tag_check_typeout_v:n { \iow_term:x {##1} }
      },
    log / vv        .code:n = {\int_set:Nn \l__tag_loglevel_int { 2 }},
    log / vvv       .code:n = {\int_set:Nn \l__tag_loglevel_int { 3 }},
    log / all       .code:n = {\int_set:Nn \l__tag_loglevel_int { 10 }},
```

(*End definition for* `log (setup-key)`*. This function is documented on page 6.*)

`tagunmarked␣(setup-key)` This key allows to set if (in luamode) unmarked text should be marked up as artifact. The initial value is true.

```
    tagunmarked     .bool_gset:N = \g__tag_tagunmarked_bool,
    tagunmarked     .initial:n  = true,
```

(*End definition for* `tagunmarked (setup-key)`*. This function is documented on page 6.*)

`tabsorder␣(setup-key)` This sets the tabsorder on a page. The values are `row`, `column`, `structure` (default) or `none`. Currently this is set more or less globally. More finer control can be added if needed.

```
    tabsorder       .choice:,
    tabsorder / row       .code:n =
      \pdfmanagement_add:nnn { Page } {Tabs}{/R},
    tabsorder / column    .code:n =
      \pdfmanagement_add:nnn { Page } {Tabs}{/C},
    tabsorder / structure .code:n =
      \pdfmanagement_add:nnn { Page } {Tabs}{/S},
    tabsorder / none      .code:n =
      \pdfmanagement_remove:nn {Page} {Tabs},
    tabsorder       .initial:n = structure,
    uncompress      .code:n = { \pdf_uncompress:  },
  }
```

(*End definition for* `tabsorder (setup-key)`*. This function is documented on page 6.*)

# 11 loading of engine/more dependent code

```

  }
⟨/debug⟩
```

# Part I
# The tagpdf-checks module Messages and check code Part of the tagpdf package

## 1 Commands

`\tag_if_active_p:` ⋆
`\tag_if_active:TF` ⋆

This command tests if tagging is active. It only gives true if all tagging has been activated, *and* if tagging hasn't been stopped locally.

`\tag_get:n` ⋆ `\tag_get:n{⟨keyword⟩}`

This is a generic command to retrieve data for the current structure or mc-chunk. Currently the only sensible values for the argument ⟨*keyword*⟩ are `mc_tag` and `struct_tag` and `struct_num`.

## 2 Description of log messages

### 2.1 \ShowTagging command

| Argument | type | note |
|---|---|---|
| \ShowTaggingmc-data = num | log+term | lua-only |
| \ShowTaggingmc-current | log+term | |
| \ShowTaggingstruck-stack= [log\|show] | log or term+stop | |

### 2.2 Messages in checks and commands

| command | message | action |
|---|---|---|
| \@@_check_structure_has_tag:n | struct-missing-tag | error |
| \@@_check_structure_tag:N | role-unknown-tag | warning |
| \@@_check_info_closing_struct:n | struct-show-closing | info |
| \@@_check_no_open_struct: | struct-faulty-nesting | error |
| \@@_check_struct_used:n | struct-used-twice | warning |
| \@@_check_add_tag_role:nn | role-missing, role-tag, role-unknown | warning, info (>0), warning |
| \@@_check_mc_if_nested:, | mc-nested | warning |
| \@@_check_mc_if_open: | mc-not-open | warning |
| \@@_check_mc_pushed_popped:nn | mc-pushed, mc-popped | info (2), info+seq_log (>2) |
| \@@_check_mc_tag:N | mc-tag-missing, role-unknown-tag | error (missing), warning (unknown). |
| \@@_check_mc_used:n | mc-used-twice | warning |
| \@@_check_show_MCID_by_page: | | |
| \tag_mc_use:n | mc-label-unknown, mc-used-twice | warning |
| \role_add_tag:nn | new-tag | info (>0) |
| | sys-no-interwordspace | warning |
| \@@_struct_write_obj:n | struct-no-objnum | error |
| \tag_struct_begin:n | struct-faulty-nesting | error |
| \@@_struct_insert_annot:nn | struct-faulty-nesting | error |
| tag_struct_use:n | struct-label-unknown | warning |
| attribute-class, attribute | attr-unknown | error |
| \@@_tree_fill_parenttree: | tree-mcid-index-wrong | warning TODO: should trigger a standard rerun m |
| in enddocument/info-hook | para-hook-count-wrong | error (warning?) |

## 2.3 Messages from the ptagging code

A few messages are issued in generic mode from the code which reinserts missing TMB/TME. This is currently done if log-level is larger than zero. TODO: reconsider log-level and messages when this code settles down.

## 2.4 Warning messages from the lua-code

The messages are triggered if the log-level is at least equal to the number.

| message | log-level | remark |
|---|---|---|
| WARN TAG-NOT-TAGGED: | 1 | |
| WARN TAG-OPEN-MC: | 1 | |
| WARN SHIPOUT-MC-OPEN: | 1 | |
| WARN SHIPOUT-UPS: | 0 | shouldn't happen |
| WARN TEX-MC-INSERT-MISSING: | 0 | shouldn't happen |
| WARN TEX-MC-INSERT-NO-KIDS: | 2 | e.g. from empty hbox |

## 2.5 Info messages from the lua-code

The messages are triggered if the log-level is at least equal to the number. `TAG` messages are from the traversing function, `TEX` from code used in the tagpdf-mc module. `PARENTREE` is the code building the parenttree.

| message | log-level | remark |
|---|---|---|
| INFO SHIPOUT-INSERT-LAST-EMC | 3 | finish of shipout code |
| INFO SPACE-FUNCTION-FONT | 3 | interwordspace code |
| INFO TAG-ABSPAGE | 3 | |
| INFO TAG-ARGS | 4 | |
| INFO TAG-ENDHEAD | 4 | |
| INFO TAG-ENDHEAD | 4 | |
| INFO TAG-HEAD | 3 | |
| INFO TAG-INSERT-ARTIFACT | 3 | |
| INFO TAG-INSERT-BDC | 3 | |
| INFO TAG-INSERT-EMC | 3 | |
| INFO TAG-INSERT-TAG | 3 | |
| INFO TAG-KERN-SUBTYPE | 4 | |
| INFO TAG-MATH-SUBTYPE | 4 | |
| INFO TAG-MC-COMPARE | 4 | |
| INFO TAG-MC-INTO-PAGE | 3 | |
| INFO TAG-NEW-MC-NODE | 4 | |
| INFO TAG-NODE | 3 | |
| INFO TAG-NO-HEAD | 3 | |
| INFO TAG-NOT-TAGGED | 2 | replaced by artifact |
| INFO TAG-QUITTING-BOX | 4 | |
| INFO TAG-STORE-MC-KID | 4 | |
| INFO TAG-TRAVERSING-BOX 3 | | |
| INFO TAG-USE-ACTUALTEXT | 3 | |
| INFO TAG-USE-ALT | 3 | |
| INFO TAG-USE-RAW | 3 | |
| INFO TEX-MC-INSERT-KID | 3 | |

| message | log-level | remark |
|---|---|---|
| INFO TEX-MC-INSERT-KID-TEST | 4 | |
| INFO TEX-MC-INTO-STRUCT | 3 | |
| INFO TEX-STORE-MC-DATA | 3 | |
| INFO TEX-STORE-MC-KID | 3 | |
| INFO PARENTTREE-CHUNKS | 3 | |
| INFO PARENTTREE-NO-DATA | 3 | |
| INFO PARENTTREE-NUM | 3 | |
| INFO PARENTTREE-NUMENTRY | 3 | |
| INFO PARENTTREE-STRUCT-OBJREF | 4 | |

## 2.6 Debug mode messages and code

If the package tagpdf-debug is loaded a number of commands are redefined and enhanced with additional commands which can be used to output debug messages or collect statistics. The commands are present but do nothing if the log-level is zero.

| command | name | action | remark |
|---|---|---|---|
| \tag_mc_begin:n | mc-begin-insert | msg | |
| | mc-begin-ignore | msg | if inactive |

## 2.7 Messages

| | |
|---|---|
| mc-nested<br>mc-tag-missing<br>mc-label-unknown<br>mc-used-twice<br>mc-not-open<br>mc-pushed<br>mc-popped<br>mc-current | Various messages related to mc-chunks. TODO document their meaning. |

| | |
|---|---|
| struct-no-objnum<br>struct-faulty-nesting<br>struct-missing-tag<br>struct-used-twice<br>struct-label-unknown<br>struct-show-closing | Various messages related to structure. TODO document their meaning. |

| | |
|---|---|
| attr-unknown | Message if an attribute i sunknown. |

| | |
|---|---|
| role-missing<br>role-unknown<br>role-unknown-tag<br>role-tag<br>new-tag | Messages related to role mapping. |

tree-mcid-index-wrong Used in the tree code, typically indicates the document must be rerun.

sys-no-interwordspace Message if an engine doesn't support inter word spaces

para-hook-count-wrong Message if the number of begin paragraph and end paragraph differ. This normally means faulty structure.

```

# 3 Messages

## 3.1 Messages related to mc-chunks

mc-nested This message is issue is a mc is opened before the previous has been closed. This is not relevant for luamode, as the attributes don't care about this. It is used in the `\@@_check_mc_if_nested:` test.

```
⟨*package⟩
\msg_new:nnn { tag } {mc-nested} { nested~marked~content~found~-~mcid~#1 }
```

(*End definition for* `mc-nested`. *This function is documented on page 18.*)

mc-tag-missing If the tag is missing

```
\msg_new:nnn { tag } {mc-tag-missing} { required~tag~missing~-~mcid~#1 }
```

(*End definition for* `mc-tag-missing`. *This function is documented on page 18.*)

mc-label-unknown If the label of a mc that is used in another place is not known (yet) or has been undefined as the mc was already used.

```
\msg_new:nnn { tag } {mc-label-unknown}
  { label~#1~unknown~or~has~been~already~used.\\
    Either~rerun~or~remove~one~of~the~uses. }
```

(*End definition for* `mc-label-unknown`. *This function is documented on page 18.*)

mc-used-twice An mc-chunk can be inserted only in one structure. This indicates wrong coding and so should at least give a warning.

```
\msg_new:nnn { tag } {mc-used-twice} { mc~#1~has~been~already~used }
```

(*End definition for* `mc-used-twice`. *This function is documented on page 18.*)

mc-not-open This is issued if a `\tag_mc_end:` is issued wrongly, wrong coding.

```
\msg_new:nnn { tag } {mc-not-open} { there~is~no~mc~to~end~at~#1 }
```

(*End definition for* `mc-not-open`. *This function is documented on page 18.*)

mc-pushed
mc-popped

Informational messages about mc-pushing.

```
\msg_new:nnn { tag } {mc-pushed} { #1~has~been~pushed~to~the~mc~stack}
\msg_new:nnn { tag } {mc-popped} { #1~has~been~removed~from~the~mc~stack }
```

(*End definition for* `mc-pushed` *and* `mc-popped`. *These functions are documented on page* 18.)

mc-current

Informational messages about current mc state.

```
\msg_new:nnn { tag } {mc-current}
  { current~MC:~
    \bool_if:NTF\g__tag_in_mc_bool
      {abscnt=\__tag_get_mc_abs_cnt:,~tag=\g__tag_mc_key_tag_tl}
      {no~MC~open,~current~abscnt=\__tag_get_mc_abs_cnt:"}
  }
```

(*End definition for* `mc-current`. *This function is documented on page* 18.)

## 3.2 Messages related to structures

struct-unknown

if for example a parent key value points to structure that doesn't exist (yet)

```
\msg_new:nnn { tag } {struct-unknown}
   { structure~with~number~#1~doesn't~exist\\ #2 }
```

(*End definition for* `struct-unknown`. *This function is documented on page* ??.)

struct-no-objnum

Should not happen ...

```
\msg_new:nnn { tag } {struct-no-objnum} { objnum~missing~for~structure~#1 }
```

(*End definition for* `struct-no-objnum`. *This function is documented on page* 18.)

struct-faulty-nesting

This indicates that there is somewhere one `\tag_struct_end:` too much. This should be normally an error.

```
\msg_new:nnn { tag }
  {struct-faulty-nesting}
  { there~is~no~open~structure~on~the~stack }
```

(*End definition for* `struct-faulty-nesting`. *This function is documented on page* 18.)

struct-missing-tag

A structure must have a tag.

```
\msg_new:nnn { tag } {struct-missing-tag} { a~structure~must~have~a~tag! }
```

(*End definition for* `struct-missing-tag`. *This function is documented on page* 18.)

struct-used-twice

```
\msg_new:nnn { tag } {struct-used-twice}
  { structure~with~label~#1~has~already~been~used}
```

(*End definition for* `struct-used-twice`. *This function is documented on page* 18.)

struct-label-unknown

label is unknown, typically needs a rerun.

```
\msg_new:nnn { tag } {struct-label-unknown}
  { structure~with~label~#1~is~unknown~rerun}
```

(*End definition for* `struct-label-unknown`. *This function is documented on page* 18.)

struct-show-closing Informational message shown if log-mode is high enough

```
\msg_new:nnn { tag } {struct-show-closing}
  { closing~structure~#1~tagged~\use:e{\prop_item:cn{g__tag_struct_#1_prop}{S}} }
```

(*End definition for* `struct-show-closing`. *This function is documented on page 18.*)

tree-struct-still-open Message issued at the end if there are beside Root other open structures on the stack.

```
\msg_new:nnn { tag } {tree-struct-still-open}
  {
    There~are~still~open~structures~on~the~stack!\\
    The~stack~contains~\seq_use:Nn\g__tag_struct_tag_stack_seq{,}.\\
    The~structures~are~automatically~closed,\\
    but~their~nesting~can~be~wrong.
  }
```

(*End definition for* `tree-struct-still-open`. *This function is documented on page* ??.)

## 3.3 Attributes

Not much yet, as attributes aren't used so much.

attr-unknown

```
\msg_new:nnn { tag } {attr-unknown}  { attribute~#1~is~unknown}
```

(*End definition for* `attr-unknown`. *This function is documented on page 18.*)

## 3.4 Roles

role-missing Warning message if either the tag or the role is missing

role-unknown

role-unknown-tag

```
\msg_new:nnn { tag } {role-missing}     { tag~#1~has~no~role~assigned  }
\msg_new:nnn { tag } {role-unknown}     { role~#1~is~not~known  }
\msg_new:nnn { tag } {role-unknown-tag} { tag~#1~is~not~known  }
```

(*End definition for* `role-missing`, `role-unknown`, *and* `role-unknown-tag`. *These functions are documented on page 18.*)

role-parent-child This is info and warning message about the containment rules between child and parent tags.

```
\msg_new:nnn { tag } {role-parent-child}
  { The~rule~between~parent~'#1'~\\and~child~'#2'~is~#3}
```

(*End definition for* `role-parent-child`. *This function is documented on page* ??.)

role-parent-child This is info and warning message about the containment rules between child and parent tags.

```
\msg_new:nnn { tag } {role-remapping}
  { remapping~tag~to~#1 }
```

(*End definition for* `role-parent-child`. *This function is documented on page* ??.)

role-tag
new-tag

Info messages.

```
\msg_new:nnn { tag } {role-tag}          { mapping~tag~#1~to~role~#2  }
\msg_new:nnn { tag } {new-tag}           { adding~new~tag~#1 }
\msg_new:nnn { tag } {read-namespace}    { reading~namespace~definitions~tagpdf-ns-
#1.def }
\msg_new:nnn { tag } {namespace-missing}{ namespace~definitions~tagpdf-ns-#1.def~not~found }
\msg_new:nnn { tag } {namespace-unknown}{ namespace~#1~is~not~declared }
```

(*End definition for* `role-tag` *and* `new-tag`. *These functions are documented on page* 18.)

## 3.5 Miscellaneous

tree-mcid-index-wrong

Used in the tree code, typically indicates the document must be rerun.

```
\msg_new:nnn { tag } {tree-mcid-index-wrong}
  {something~is~wrong~with~the~mcid--rerun}
```

(*End definition for* `tree-mcid-index-wrong`. *This function is documented on page* 19.)

sys-no-interwordspace

Currently only pdflatex and lualatex have some support for real spaces.

```
\msg_new:nnn { tag } {sys-no-interwordspace}
  {engine/output~mode~#1~doesn't~support~the~interword~spaces}
```

(*End definition for* `sys-no-interwordspace`. *This function is documented on page* 19.)

__tag_check_typeout_v:n

A simple logging function. By default is gobbles its argument, but the log-keys sets it to typeout.

```
\cs_set_eq:NN \__tag_check_typeout_v:n \use_none:n
```

(*End definition for* `\__tag_check_typeout_v:n`.)

para-hook-count-wrong

At the end of the document we check if the count of para-begin and para-end is identical. If not we issue a warning: this is normally a coding error and and breaks the structure.

```
\msg_new:nnnn { tag } {para-hook-count-wrong}
  {The~number~of~automatic~begin~(#1)~and~end~(#2)~para~hooks~differ!}
  {This~quite~probably~a~coding~error~and~the~structure~will~be~wrong!}
⟨/package⟩
```

(*End definition for* `para-hook-count-wrong`. *This function is documented on page* 19.)

# 4 Retrieving data

\tag_get:n

This retrieves some data. This is a generic command to retrieve data. Currently the only sensible values for the argument are `mc_tag`, `struct_tag` and `struct_num`.

```
⟨base⟩\cs_new:Npn \tag_get:n #1   { \use:c {__tag_get_data_#1: } }
```

(*End definition for* `\tag_get:n`. *This function is documented on page* 16.)

# 5 User conditionals

\tag_if_active_p:
\tag_if_active:*TF*

This is a test it tagging is active. This allows packages to add conditional code. The test is true if all booleans, the global and the two local one are true.

```
⟨*base⟩
\prg_new_conditional:Npnn \tag_if_active: { p , T , TF, F }
  { \prg_return_false: }
⟨/base⟩
⟨*package⟩
\prg_set_conditional:Npnn \tag_if_active: { p , T , TF, F }
  {
     \bool_lazy_all:nTF
       {
         {\g__tag_active_struct_bool}
         {\g__tag_active_mc_bool}
         {\g__tag_active_tree_bool}
         {\l__tag_active_struct_bool}
         {\l__tag_active_mc_bool}
       }
       {
         \prg_return_true:
       }
       {
         \prg_return_false:
       }
  }
```

(*End definition for* `\tag_if_active:TF`*. This function is documented on page 16.*)

# 6 Internal checks

These are checks used in various places in the code.

## 6.1 checks for active tagging

__tag_check_if_active_mc:*TF*
__tag_check_if_active_struct:*TF*

Structures must have a tag, so we check if the S entry is in the property. It is an error if this is missing. The argument is a number.

```
\prg_new_conditional:Npnn \__tag_check_if_active_mc: {T,F,TF}
  {
    \bool_lazy_and:nnTF { \g__tag_active_mc_bool } { \l__tag_active_mc_bool }
      {
         \prg_return_true:
      }
      {
         \prg_return_false:
      }
  }
\prg_new_conditional:Npnn \__tag_check_if_active_struct: {T,F,TF}
  {
    \bool_lazy_and:nnTF { \g__tag_active_struct_bool } { \l__tag_active_struct_bool }
      {
         \prg_return_true:
```

```
      }
      {
         \prg_return_false:
      }
  }
```

(*End definition for* `\__tag_check_if_active_mc:TF` *and* `\__tag_check_if_active_struct:TF`.)

## 6.2 Checks related to structures

`\__tag_check_structure_has_tag:n` Structures must have a tag, so we check if the S entry is in the property. It is an error if this is missing. The argument is a number. The tests for existence and type is split in structures, as the tags are stored differently to the mc case.

```
\cs_new_protected:Npn \__tag_check_structure_has_tag:n #1 %#1 struct num
  {
    \prop_if_in:cnF { g__tag_struct_#1_prop }
      {S}
      {
        \msg_error:nn { tag } {struct-missing-tag}
      }
  }
```

(*End definition for* `\__tag_check_structure_has_tag:n`.)

`\__tag_check_structure_tag:N` This checks if the name of the tag is known, either because it is a standard type or has been rolemapped.

```
\cs_new_protected:Npn \__tag_check_structure_tag:N #1
  {
    \prop_if_in:NoF \g__tag_role_tags_NS_prop {#1}
      {
        \msg_warning:nnx { tag } {role-unknown-tag} {#1}
      }
  }
```

(*End definition for* `\__tag_check_structure_tag:N`.)

`\__tag_check_info_closing_struct:n` This info message is issued at a closing structure, the use should be guarded by log-level.

```
\cs_new_protected:Npn \__tag_check_info_closing_struct:n #1 %#1 struct num
  {
    \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
      {
        \msg_info:nnn { tag } {struct-show-closing} {#1}
      }
  }

\cs_generate_variant:Nn \__tag_check_info_closing_struct:n {o,x}
```

(*End definition for* `\__tag_check_info_closing_struct:n`.)

`\__tag_check_no_open_struct:` This checks if there is an open structure. It should be used when trying to close a structure. It errors if false.

```
\cs_new_protected:Npn \__tag_check_no_open_struct:
  {
    \msg_error:nn { tag } {struct-faulty-nesting}
  }
```

(*End definition for* `\__tag_check_no_open_struct:`.)

`\__tag_check_struct_used:n` This checks if a stashed structure has already been used.

```
\cs_new_protected:Npn \__tag_check_struct_used:n #1 %#1 label
  {
    \prop_get:cnNT
      {g__tag_struct_\__tag_ref_value:enn{tagpdfstruct-#1}{tagstruct}{unknown}_prop}
      {P}
      \l_tmpa_tl
      {
        \msg_warning:nnn { tag } {struct-used-twice} {#1}
      }
  }
```

(*End definition for* `\__tag_check_struct_used:n`.)

## 6.3 Checks related to roles

`\__tag_check_add_tag_role:nn` This check is used when defining a new role mapping.

```
\cs_new_protected:Npn \__tag_check_add_tag_role:nn #1 #2 %#1 tag, #2 role
  {
    \tl_if_empty:nTF {#2}
      {
        \msg_error:nnn { tag } {role-missing} {#1}
      }
      {
        \prop_get:NnNTF \g__tag_role_tags_NS_prop {#2} \l_tmpa_tl
          {
            \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
              {
                \msg_info:nnnn { tag } {role-tag} {#1} {#2}
              }
          }
          {
            \msg_error:nnn { tag } {role-unknown} {#2}
          }
      }
  }
```

Similar with a namespace

```
\cs_new_protected:Npn \__tag_check_add_tag_role:nnn #1 #2 #3 %#1 tag/NS, #2 role #3 namespace
  {
    \tl_if_empty:nTF {#2}
      {
        \msg_error:nnn { tag } {role-missing} {#1}
      }
      {
        \prop_get:cnNTF { g__tag_role_NS_#3_prop } {#2} \l_tmpa_tl
          {
            \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
              {
                \msg_info:nnnn { tag } {role-tag} {#1} {#2/#3}
              }
          }
```

```
          {
            \msg_error:nnn { tag } {role-unknown} {#2/#3}
          }
      }
  }
```

(*End definition for* `\__tag_check_add_tag_role:nn`.)

## 6.4 Check related to mc-chunks

`\__tag_check_mc_if_nested:`
`\__tag_check_mc_if_open:`

Two tests if a mc is currently open. One for the true (for begin code), one for the false part (for end code).

```
\cs_new_protected:Npn \__tag_check_mc_if_nested:
  {
    \__tag_mc_if_in:T
      {
        \msg_warning:nnx { tag } {mc-nested} { \__tag_get_mc_abs_cnt: }
      }
  }

\cs_new_protected:Npn \__tag_check_mc_if_open:
  {
    \__tag_mc_if_in:F
      {
        \msg_warning:nnx { tag } {mc-not-open} { \__tag_get_mc_abs_cnt: }
      }
  }
```

(*End definition for* `\__tag_check_mc_if_nested:` *and* `\__tag_check_mc_if_open:`.)

`\__tag_check_mc_pushed_popped:nn`

This creates an information message if mc's are pushed or popped. The first argument is a word (pushed or popped), the second the tag name. With larger log-level the stack is shown too.

```
\cs_new_protected:Npn \__tag_check_mc_pushed_popped:nn #1 #2
  {
    \int_compare:nNnT
      { \l__tag_loglevel_int } ={ 2 }
      { \msg_info:nnx {tag}{mc-#1}{#2} }
    \int_compare:nNnT
      { \l__tag_loglevel_int } > { 2 }
      {
        \msg_info:nnx {tag}{mc-#1}{#2}
        \seq_log:N \g__tag_mc_stack_seq
      }
  }
```

(*End definition for* `\__tag_check_mc_pushed_popped:nn`.)

`\__tag_check_mc_tag:N`

This checks if the mc has a (known) tag.

```
\cs_new_protected:Npn \__tag_check_mc_tag:N #1  %#1 is var with a tag name in it
  {
    \tl_if_empty:NT #1
      {
        \msg_error:nnx { tag } {mc-tag-missing} { \__tag_get_mc_abs_cnt: }
```

```
      }
    \prop_if_in:NoF \g__tag_role_tags_NS_prop {#1}
      {
        \msg_warning:nnx { tag } {role-unknown-tag} {#1}
      }
  }
```

(*End definition for* `\__tag_check_mc_tag:N`.)

`\g__tag_check_mc_used_intarray`
`\__tag_check_init_mc_used:`

This variable holds the list of used mc numbers. Everytime we store a mc-number we will add one the relevant array index If everything is right at the end there should be only 1 until the max count of the mcid. 2 indicates that one mcid was used twice, 0 that we lost one. In engines other than luatex the total number of all intarray entries are restricted so we use only a rather small value of 65536, and we initialize the array only at first used, guarded by the log-level. This check is probably only needed for debugging. TODO does this really make sense to check? When can it happen??

```
\cs_new_protected:Npn \__tag_check_init_mc_used:
  {
    \intarray_new:Nn \g__tag_check_mc_used_intarray { 65536 }
    \cs_gset_eq:NN \__tag_check_init_mc_used: \prg_do_nothing:
  }
```

(*End definition for* `\g__tag_check_mc_used_intarray` *and* `\__tag_check_init_mc_used:`.)

`\__tag_check_mc_used:n`

This checks if a mc is used twice.

```
\cs_new_protected:Npn \__tag_check_mc_used:n #1 %#1 mcid abscnt
  {
    \int_compare:nNnT {\l__tag_loglevel_int} > { 2 }
      {
        \__tag_check_init_mc_used:
        \intarray_gset:Nnn \g__tag_check_mc_used_intarray
          {#1}
          { \intarray_item:Nn \g__tag_check_mc_used_intarray {#1} + 1 }
        \int_compare:nNnT
          {
            \intarray_item:Nn \g__tag_check_mc_used_intarray {#1}
          }
          >
          { 1 }
          {
            \msg_warning:nnn { tag } {mc-used-twice} {#1}
          }
      }
  }
```

(*End definition for* `\__tag_check_mc_used:n`.)

`\__tag_check_show_MCID_by_page:`

This allows to show the mc on a page. Currently unused.

```
\cs_new_protected:Npn \__tag_check_show_MCID_by_page:
  {
    \tl_set:Nx \l__tag_tmpa_tl
      {
        \__tag_ref_value_lastpage:nn
          {abspage}
```

```
          {-1}
      }
    \int_step_inline:nnnn {1}{1}
      {
        \l__tag_tmpa_tl
      }
      {
        \seq_clear:N \l_tmpa_seq
        \int_step_inline:nnnn
          {1}
          {1}
          {
            \__tag_ref_value_lastpage:nn
              {tagmcabs}
              {-1}
          }
          {
            \int_compare:nT
              {
                \__tag_ref_value:enn
                  {mcid-####1}
                  {tagabspage}
                  {-1}
                =
                ##1
              }
              {
                \seq_gput_right:Nx \l_tmpa_seq
                  {
                    Page##1-####1-
                    \__tag_ref_value:enn
                      {mcid-####1}
                      {tagmcid}
                      {-1}
                  }
              }
          }
          \seq_show:N \l_tmpa_seq
      }
  }
```

(*End definition for* `\__tag_check_show_MCID_by_page:`.)

## 6.5 Checks related to the state of MC on a page or in a split stream

The following checks are currently only usable in generic mode as they rely on the marks defined in the mc-generic module. They are used to detect if a mc-chunk has been split by a page break or similar and additional end/begin commands are needed.

`\__tag_check_mc_in_galley_p:`
`\__tag_check_mc_in_galley:`*TF*

At first we need a test to decide if `\tag_mc_begin:n` (tmb) and `\tag_mc_end:` (tme) has been used at all on the current galley. As each command issues two slightly different marks we can do it by comparing firstmarks and botmarks. The test assumes that

the marks have been already mapped into the sequence with `\@@_mc_get_marks:`. As `\seq_if_eq:NNTF` doesn't exist we use the tl-test.

```
\prg_new_conditional:Npnn \__tag_check_if_mc_in_galley: { T,F,TF }
 {
   \tl_if_eq:NNTF \l__tag_mc_firstmarks_seq \l__tag_mc_botmarks_seq
    { \prg_return_false: }
    { \prg_return_true: }
 }
```

(*End definition for* `\__tag_check_mc_in_galley:TF`.)

`\__tag_check_if_mc_tmb_missing_p:`
`\__tag_check_if_mc_tmb_missing:TF`

This checks if a extra top mark ("extra-tmb") is needed. According to the analysis this the case if the firstmarks start with `e-` or `b+`. Like above we assume that the marks content is already in the seq's.

```
\prg_new_conditional:Npnn \__tag_check_if_mc_tmb_missing: { T,F,TF }
 {
  \bool_if:nTF
    {
      \str_if_eq_p:ee {\seq_item:Nn \l__tag_mc_firstmarks_seq {1}}{e-}
      ||
      \str_if_eq_p:ee {\seq_item:Nn \l__tag_mc_firstmarks_seq {1}}{b+}
    }
    { \prg_return_true: }
    { \prg_return_false: }
 }
```

(*End definition for* `\__tag_check_if_mc_tmb_missing:TF`.)

`\__tag_check_if_mc_tme_missing_p:`
`\__tag_check_if_mc_tme_missing:TF`

This checks if a extra bottom mark ("extra-tme") is needed. According to the analysis this the case if the botmarks starts with `b+`. Like above we assume that the marks content is already in the seq's.

```
\prg_new_conditional:Npnn \__tag_check_if_mc_tme_missing: { T,F,TF }
 {
   \str_if_eq:eeTF {\seq_item:Nn \l__tag_mc_botmarks_seq {1}}{b+}
    { \prg_return_true: }
    { \prg_return_false: }
 }
```

(*End definition for* `\__tag_check_if_mc_tme_missing:TF`.)

⟨/package⟩

⟨*debug⟩

Code for tagpdf-debug. This will probably change over time. At first something for the mc commands.

```
\msg_new:nnn { tag / debug } {mc-begin} { MC~begin~#1~with~options:~\tl_to_str:n{#2}~[\msg_lin
\msg_new:nnn { tag / debug } {mc-end}   { MC~end~#1~[\msg_line_context:] }

\cs_new_protected:Npn \__tag_debug_mc_begin_insert:n #1
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnnn { tag / debug } {mc-begin} {inserted} { #1 }
     }
```

```
 }
\cs_new_protected:Npn \__tag_debug_mc_begin_ignore:n #1
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnnn { tag / debug } {mc-begin } {ignored} { #1 }
     }
 }
\cs_new_protected:Npn \__tag_debug_mc_end_insert:
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnn { tag / debug } {mc-end} {inserted}
     }
 }
\cs_new_protected:Npn \__tag_debug_mc_end_ignore:
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnn { tag / debug } {mc-end } {ignored}
     }
 }
```

And now something for the structures

```
\msg_new:nnn { tag / debug } {struct-begin}
  {
    Struct~\tag_get:n{struct_num}~begin~#1~with~options:~\tl_to_str:n{#2}~[\msg_line_context:]
  }
\msg_new:nnn { tag / debug } {struct-end}
  {
    Struct~end~#1~[\msg_line_context:]
  }

\cs_new_protected:Npn \__tag_debug_struct_begin_insert:n #1
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnnn { tag / debug } {struct-begin} {inserted} { #1 }
        \seq_log:N \g__tag_struct_tag_stack_seq
     }
 }
\cs_new_protected:Npn \__tag_debug_struct_begin_ignore:n #1
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnnn { tag / debug } {struct-begin } {ignored} { #1 }
     }
 }
\cs_new_protected:Npn \__tag_debug_struct_end_insert:
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnn { tag / debug } {struct-end} {inserted}
        \seq_log:N \g__tag_struct_tag_stack_seq
     }
```

```
 }
\cs_new_protected:Npn \__tag_debug_struct_end_ignore:
 {
   \int_compare:nNnT { \l__tag_loglevel_int } > {0}
     {
        \msg_note:nnn { tag / debug } {struct-end } {ignored}
     }
 }
```
⟨/debug⟩

# Part II
# The tagpdf-user module
# Code related to LaTeX2e user commands and document commands
# Part of the tagpdf package

## 1 Setup commands

`\tagpdfsetup` `\tagpdfsetup{⟨key val list⟩}`

This is the main setup command to adapt the behaviour of tagpdf. It can be used in the preamble and in the document (but not all keys make sense there).

`activate␣(setup-key)` And additional setup key which combine the other activate keys `activate-mc`, `activate-tree`, `activate-struct` and additionally add a document structure.

`\tagpdfifluatexTF`
`\tagpdfifluatexT`
`\tagpdfifpdftexT`

small wrappers around engine tests. This functions should not be used and will be removed in one of the next versions.

## 2 Commands related to mc-chunks

`\tagmcbegin` `\tagmcbegin {⟨key-val⟩}`
`\tagmcend` `\tagmcend`
`\tagmcuse` `\tagmcuse{⟨label⟩}`

These are wrappers around `\tag_mc_begin:n`, `\tag_mc_end:` and `\tag_mc_use:n`. The commands and their argument are documentated in the tagpdf-mc module. In difference to the expl3 commands, `\tagmcbegin` issues also an `\ignorespaces`, and `\tagmcend` will issue in horizontal mode an `\unskip`.

`\tagmcifinTF` `\tagmcifin {⟨true code⟩}{⟨false code⟩}`

This is a wrapper around `\tag_mc_if_in:TF`. and tests if an mc is open or not. It is mostly of importance for pdflatex as lualatex doesn't mind much if a mc tag is not correctly closed. Unlike the expl3 command it is not expandable.

The command is probably not of much use and will perhaps disappear in future versions. It normally makes more sense to push/pop an mc-chunk.

# 3 Commands related to structures

`\tagstructbegin` `\tagstructbegin {⟨key-val⟩}`
`\tagstructend` `\tagstructend`
`\tagstructuse` `\tagstructuse{⟨label⟩}`

These are direct wrappers around `\tag_struct_begin:n`, `\tag_struct_end:` and `\tag_struct_use:n`. The commands and their argument are documentated in the tagpdf-struct module.

# 4 Debugging

`\ShowTagging` `\ShowTagging {⟨key-val⟩}`

This is a generic function to output various debugging helps. It not necessarly stops the compilation. The keys and their function are described below.

`mc-data␣(show-key)` `mc-data = ⟨number⟩`

This key is (currently?) relevant for lua mode only. It shows the data of all mc-chunks created so far. It is accurate only after shipout (and perhaps a second compilation), so typically should be issued after a newpage. The value is a positive integer and sets the first mc-shown. If no value is given, 1 is used and so all mc-chunks created so far are shown.

`mc-current␣(show-key)` `mc-current`

This key shows the number and the tag of the currently open mc-chunk. If no chunk is open it shows only the state of the abs count. It works in all mode, but the output in luamode looks different.

`mc-marks␣(show-key)` `mc-marks = show|use`

This key helps to debug the page marks. It should only be used at shipout in header or footer.

`struct-stack␣(show-key)` `struct-stack = log|show`

This key shows the current structure stack. With `log` the info is only written to the log-file, `show` stops the compilation and shows on the terminal. If no value is used, then the default is `show`.

# 5 Extension commands

The following commands and code parts are not core command of tagpdf. They either provide work-arounds for missing functionality elsewhere, or do a first step to apply tagpdf commands to document commands.

The commands and keys should be view as experimental!

This part will be regularly revisited to check if the code should go to a better place or can be improved and so can change easily.

## 5.1 Fake space

`\pdffakespace` (lua-only) This provides a lua-version of the `\pdffakespace` primitive of pdftex.

## 5.2 Paratagging

This is a first try to make use of the new paragraph hooks in a current LaTeX to automate the tagging of paragraph. It requires sane paragraph nesting, faulty code, e.g. a missing `\par` at the end of a low-level vbox can highly confuse the tagging. The tags should be carefully checked if this is used.

`paratagging␣(setup-key)` `paratagging = true|false`
`paratagging-show␣(setup-key)` `paratagging-show = true|false`

This keys can be used in `\tagpdfsetup` and enable/disable paratagging. `paratagging-show` puts small red numbers at the begin and end of a paragraph. This is meant as a debugging help. The number are boxes and have a (tiny) height, so they can affect typesetting.

`\tagpdfparaOn` `\tagpdfparaOff` These commands allow to enable/disable para tagging too and are a bit faster then `\tagpdfsetup`. But I'm not sure if the names are good.

`\tagpdfsuppressmarks` This command allows to suppress the creation of the marks. It takes an argument which should normally be one of the mc-commands, puts a group around it and suppress the marks creation in this group. This command should be used if the begin and end command are at different boxing levels. E.g.

```
\@hangfrom
 {
  \tagstructbegin{tag=H1}%
  \tagmcbegin    {tag=H1}%
  #2
 }
 {#3\tagpdfsuppressmarks{\tagmcend}\tagstructend}%
```

## 5.3 Header and footer

Header and footer are automatically excluded from tagging. This can be disabled with the following key. If some real content is in the header and footer, tagging must be restarted there explicitly. The key accepts the values `true` which surrounds the header with an artifact mc-chunk, `false` which disables the automatic tagging, and `pagination` which additionally adds an artifact structure with an pagination attribute.

`exclude-header-footer␣(setup-key)` `exclude-header-footer = true|false|pagination`

### 5.4 Link tagging

Links need a special structure and cross reference system. This is added through hooks of the l3pdfannot module and will work automatically if tagging is activated.

Links should (probably) have an alternative text in the Contents key. It is unclear which text this should be and how to get it. Currently the code simply adds the fix texts `url` and `ref`. Another text can be added by changing the dictionary value:

```
\pdfannot_dict_put:nnn
{ link/GoTo }
{ Contents }
{ (ref) }
```

# 6 User commands and extensions of document commands

```
⟨@@=tag⟩
⟨*header⟩
\ProvidesExplPackage {tagpdf-user} {2022-08-24} {0.97}
  {tagpdf - user commands}
⟨/header⟩
```

# 7 Setup and preamble commands

\tagpdfsetup

```
⟨base⟩\NewDocumentCommand \tagpdfsetup { m }{}
⟨*package⟩
\RenewDocumentCommand \tagpdfsetup { m }
  {
    \keys_set:nn { __tag / setup } { #1 }
  }
⟨/package⟩
```

(*End definition for* `\tagpdfsetup`. *This function is documented on page* 32.)

# 8 Commands for the mc-chunks

\tagmcbegin
\tagmcend
\tagmcuse

```
⟨*base⟩
\NewDocumentCommand \tagmcbegin { m }
  {
    \tag_mc_begin:n {#1}
  }

\NewDocumentCommand \tagmcend {  }
  {
    \tag_mc_end:
  }

\NewDocumentCommand \tagmcuse { m }
```

```
  {
    \tag_mc_use:n {#1}
  }
⟨/base⟩
```

(*End definition for* `\tagmcbegin`, `\tagmcend`, *and* `\tagmcuse`. *These functions are documented on page 32.*)

`\tagmcifinTF` This is a wrapper around `\tag_mc_if_in:` and tests if an mc is open or not. It is mostly of importance for pdflatex as lualatex doesn't mind much if a mc tag is not correctly closed. Unlike the expl3 command it is not expandable.

```
⟨*package⟩
\NewDocumentCommand \tagmcifinTF { m m }
  {
    \tag_mc_if_in:TF { #1 } { #2 }
  }
⟨/package⟩
```

(*End definition for* `\tagmcifinTF`. *This function is documented on page 32.*)

# 9 Commands for the structure

`\tagstructbegin` `\tagstructend` `\tagstructuse` These are structure related user commands. There are direct wrapper around the expl3 variants.

```
⟨*base⟩
\NewDocumentCommand \tagstructbegin { m }
  {
    \tag_struct_begin:n {#1}
  }

\NewDocumentCommand \tagstructend {  }
  {
   \tag_struct_end:
  }

\NewDocumentCommand \tagstructuse { m }
  {
    \tag_struct_use:n {#1}
  }
⟨/base⟩
```

(*End definition for* `\tagstructbegin`, `\tagstructend`, *and* `\tagstructuse`. *These functions are documented on page 33.*)

# 10 Debugging

`\ShowTagging` This is a generic command for various show commands. It takes a keyval list, the various keys are implemented below.

```
⟨*package⟩
\NewDocumentCommand\ShowTagging { m }
  {
    \keys_set:nn { __tag / show }{ #1}
```

```
}
```

(*End definition for* `\ShowTagging`. *This function is documented on page 33.*)

`mc-data␣(show-key)` This key is (currently?) relevant for lua mode only. It shows the data of all mc-chunks created so far. It is accurate only after shipout, so typically should be issued after a newpage. With the optional argument the minimal number can be set.

```
\keys_define:nn { __tag / show }
  {
    mc-data .code:n =
      {
        \sys_if_engine_luatex:T
          {
            \lua_now:e{ltx.__tag.trace.show_all_mc_data(#1,\__tag_get_mc_abs_cnt:,0)}
          }
      }
    ,mc-data .default:n = 1
  }

```

(*End definition for* `mc-data (show-key)`. *This function is documented on page 33.*)

`mc-current␣(show-key)` This shows some info about the current mc-chunk. It works in generic and lua-mode.

```
\keys_define:nn { __tag / show }
  { mc-current .code:n =
     {
       \bool_if:NTF \g__tag_mode_lua_bool
         {
           \sys_if_engine_luatex:T
             {
               \int_compare:nNnTF
                 { -2147483647 }
                  =
                 {
                   \lua_now:e
                     {
                        tex.print
                         (tex.getattribute
                           (luatexbase.attributes.g__tag_mc_cnt_attr))
                     }
                 }
                 {
                   \lua_now:e
                     {
                       ltx.__tag.trace.log
                        (
                          "mc-current:~no~MC~open,~current~abscnt
                           =\__tag_get_mc_abs_cnt:"
                          ,0
                        )
                       texio.write_nl("")
                     }
                 }
```

```
                {
                  \lua_now:e
                    {
                      ltx.__tag.trace.log
                       (
                         "mc-current:~abscnt=\__tag_get_mc_abs_cnt:=="
                          ..
                          tex.getattribute(luatexbase.attributes.g__tag_mc_cnt_attr)
                          ..
                          "~=>tag="
                          ..
                          tostring
                            (ltx.__tag.func.get_tag_from
                              (tex.getattribute
                                (luatexbase.attributes.g__tag_mc_type_attr)))
                          ..
                          "="
                          ..
                          tex.getattribute
                           (luatexbase.attributes.g__tag_mc_type_attr)
                          ,0
                       )
                      texio.write_nl("")
                    }
                }
            }
        }
        {
         \msg_note:nn{ tag }{ mc-current }
        }
    }
}
```

(*End definition for* `mc-current (show-key)`. *This function is documented on page 33.*)

`mc-marks␣(show-key)` It maps the mc-marks into the sequences and then shows them. This allows to inspect the first and last mc-Mark on a page. It should only be used in the shipout (header/footer).

```
\keys_define:nn { __tag / show }
  {
    mc-marks .choice: ,
    mc-marks / show .code:n =
      {
        \__tag_mc_get_marks:
        \__tag_check_if_mc_in_galley:TF
         {
          \iow_term:n {Marks~from~this~page:~}
         }
         {
           \iow_term:n {Marks~from~a~previous~page:~}
         }
        \seq_show:N \l__tag_mc_firstmarks_seq
        \seq_show:N \l__tag_mc_botmarks_seq
        \__tag_check_if_mc_tmb_missing:T
         {
```

```
            \iow_term:n {BDC~missing~on~this~page!}
          }
        \__tag_check_if_mc_tme_missing:T
          {
            \iow_term:n {EMC~missing~on~this~page!}
          }
      },
    mc-marks / use .code:n =
      {
        \__tag_mc_get_marks:
        \__tag_check_if_mc_in_galley:TF
          { Marks~from~this~page:~}
          { Marks~from~a~previous~page:~}
        \seq_use:Nn \l__tag_mc_firstmarks_seq {,~}\quad
        \seq_use:Nn \l__tag_mc_botmarks_seq {,~}\quad
        \__tag_check_if_mc_tmb_missing:T
          {
            BDC~missing~
          }
        \__tag_check_if_mc_tme_missing:T
          {
            EMC~missing
          }
      },
   mc-marks .default:n = show
  }
```

(*End definition for* `mc-marks (show-key)`. *This function is documented on page 33.*)

`struct-stack␣(show-key)`

```
\keys_define:nn { __tag / show }
  {
     struct-stack .choice:
    ,struct-stack / log .code:n = \seq_log:N \g__tag_struct_tag_stack_seq
    ,struct-stack / show .code:n = \seq_show:N \g__tag_struct_tag_stack_seq
    ,struct-stack .default:n = show
  }
```

(*End definition for* `struct-stack (show-key)`. *This function is documented on page 33.*)

# 11 Commands to extend document commands

The following commands and code parts are not core command of tagpdf. The either provide work arounds for missing functionality elsewhere, or do a first step to apply tagpdf commands to document commands. This part should be regularly revisited to check if the code should go to a better place or can be improved.

## 11.1 Document structure

`\__tag_add_document_structure:n`
`activate␣(setup-key)`

```
\cs_new_protected:Npn \__tag_add_document_structure:n #1
 {
   \hook_gput_code:nnn{begindocument}{tagpdf}{\tagstructbegin{tag=#1}}
```

```
    \hook_gput_code:nnn{tagpdf/finish/before}{tagpdf}{\tagstructend}
  }
\keys_define:nn { __tag / setup}
  {
    activate   .code:n =
     {
       \keys_set:nn { __tag / setup }
         { activate-mc,activate-tree,activate-struct }
       \__tag_add_document_structure:n {#1}
     },
   activate .default:n = Document
  }
```

(*End definition for* `\__tag_add_document_structure:n` *and* `activate (setup-key)`*. This function is documented on page 32.*)

## 11.2 Structure destinations

In TeXlive 2022 pdftex and luatex will offer support for structure destinations. The pdfmanagement has already backend support. We activate them if the prerequisites are there: structures should be activated, the code in the pdfmanagement must be there. Structure destinations are actually PDF 2.0 only but they don't harm in older PDF and can improve html export.

```
\AddToHook{begindocument/before}
  {
    \bool_lazy_all:nT
      {
        { \g__tag_active_struct_dest_bool }
        { \g__tag_active_struct_bool }
        { \cs_if_exist_p:N \pdf_activate_structure_destination: }
      }
      {
        \tl_set:Nn \l_pdf_current_structure_destination_tl { __tag/struct/\g__tag_struct_stack
        \pdf_activate_structure_destination:
      }
   }
```

## 11.3 Fake space

`\pdffakespace` We need a luatex variant for `\pdffakespace`. This should probably go into the kernel at some time.

```
\sys_if_engine_luatex:T
  {
    \NewDocumentCommand\pdffakespace { }
     {
       \__tag_fakespace:
     }
  }
```

(*End definition for* `\pdffakespace`*. This function is documented on page 34.*)

## 11.4 Paratagging

The following are some simple commands to enable/disable paratagging. Probably one should add some checks if we are already in a paragraph.

\l__tag_para_bool
\l__tag_para_show_bool
\g__tag_para_int
\l__tag_para_tag_default_tl

At first some variables.

```
\bool_new:N \l__tag_para_bool
\bool_new:N \l__tag_para_show_bool
\int_new:N  \g__tag_para_begin_int
\int_new:N  \g__tag_para_end_int
\tl_new:N   \l__tag_para_tag_default_tl
\tl_set:Nn  \l__tag_para_tag_default_tl { P }
\tl_new:N   \l__tag_para_tag_tl
\tl_set:Nn  \l__tag_para_tag_tl { \l__tag_para_tag_default_tl }
```

(*End definition for* `\l__tag_para_bool` *and others.*)

paratagging␣(setup-key)
paratagging-show␣(setup-key)

These keys enable/disable locally paratagging, and the debug modus. It can affect the typesetting if `paratagging-show` is used. The small numbers are boxes and they have a (small) height.

```
\keys_define:nn { __tag / setup }
  {
    paratagging      .bool_set:N = \l__tag_para_bool,
    paratagging-show .bool_set:N = \l__tag_para_show_bool,
    paratag          .tl_set:N   = \l__tag_para_tag_tl
  }

```

(*End definition for* `paratagging (setup-key)` *and* `paratagging-show (setup-key)`*. These functions are documented on page 34.*)

This fills the para hooks with the needed code.

```
\AddToHook{para/begin}
  {
   \bool_if:NT \l__tag_para_bool
     {
       \int_gincr:N \g__tag_para_begin_int
       \tag_struct_begin:n {tag=\l__tag_para_tag_tl}
       \bool_if:NT \l__tag_para_show_bool
        { \tag_mc_begin:n{artifact}
          \llap{\color_select:n{red}\tiny\int_use:N\g__tag_para_begin_int\ }
          \tag_mc_end:
        }
       \tag_mc_begin:n {}
     }
  }
\AddToHook{para/end}
  {
    \bool_if:NT \l__tag_para_bool
      {
        \int_gincr:N \g__tag_para_end_int
        \tag_mc_end:
        \bool_if:NT \l__tag_para_show_bool
          { \tag_mc_begin:n{artifact}
            \rlap{\color_select:n{red}\tiny\ \int_use:N\g__tag_para_end_int}
```

```
            \tag_mc_end:
          }
        \tag_struct_end:
      }
  }
\AddToHook{enddocument/info}
  {
    \int_compare:nNnF {\g__tag_para_begin_int}={\g__tag_para_end_int}
      {
        \msg_error:nnxx
          {tag}
          {para-hook-count-wrong}
          {\int_use:N\g__tag_para_begin_int}
          {\int_use:N\g__tag_para_end_int}
      }
  }
```

In generic mode we need the additional code from the ptagging tests.

```
\AddToHook{begindocument/before}
 {
   \bool_if:NF \g__tag_mode_lua_bool
     {
        \cs_if_exist:NT \@kernel@before@footins
         {
           \tl_put_right:Nn \@kernel@before@footins
             { \__tag_add_missing_mcs_to_stream:Nn \footins {footnote} }
           \tl_put_right:Nn \@kernel@before@cclv
             {
               \__tag_check_typeout_v:n {====>~In~\token_to_str:N \@makecol\c_space_tl\the\c@p
               \__tag_add_missing_mcs_to_stream:Nn \@cclv {main}
             }
           \tl_put_right:Nn \@mult@ptagging@hook
             {
               \__tag_check_typeout_v:n {====>~In~\string\page@sofar}
               \process@cols\mult@firstbox
                {
                  \__tag_add_missing_mcs_to_stream:Nn \count@ {multicol}
                }
               \__tag_add_missing_mcs_to_stream:Nn \mult@rightbox {multicol}
             }
         }
     }
 }
⟨/package⟩
```

\tagpdfparaOn
\tagpdfparaOff

This two command switch para mode on and off. \tagpdfsetup could be used too but is longer.

```
⟨base⟩\newcommand\tagpdfparaOn {}
⟨base⟩\newcommand\tagpdfparaOff{}
⟨*package⟩
\renewcommand\tagpdfparaOn {\bool_set_true:N \l__tag_para_bool}
\renewcommand\tagpdfparaOff{\bool_set_false:N \l__tag_para_bool}
```

(*End definition for* \tagpdfparaOn *and* \tagpdfparaOff*. These functions are documented on page 34.*)

\tagpdfsuppressmarks This command allows to suppress the creation of the marks. It takes an argument which should normally be one of the mc-commands, puts a group around it and suppress the marks creation in this group. This command should be used if the begin and end command are at different boxing levels. E.g.

```
\@hangfrom
 {
  \tagstructbegin{tag=H1}%
  \tagmcbegin    {tag=H1}%
  #2
 }
 {#3\tagpdfsuppressmarks{\tagmcend}\tagstructend}%
```

```
\NewDocumentCommand\tagpdfsuppressmarks{m}
  {{\use:c{__tag_mc_disable_marks:} #1}}
```

(*End definition for* `\tagpdfsuppressmarks`*. This function is documented on page 34.*)

## 11.5 Header and footer

Header and footer should normally be tagged as artifacts. The following code requires the new hooks. For now we allow to disable this function, but probably the code should always there at the end. TODO check if Pagination should be changeable.

```
\cs_new_protected:Npn\__tag_hook_kernel_before_head:{}
\cs_new_protected:Npn\__tag_hook_kernel_after_head:{}
\cs_new_protected:Npn\__tag_hook_kernel_before_foot:{}
\cs_new_protected:Npn\__tag_hook_kernel_after_foot:{}

\AddToHook{begindocument}
 {
  \cs_if_exist:NT \@kernel@before@head
   {
     \tl_put_right:Nn \@kernel@before@head {\__tag_hook_kernel_before_head:}
     \tl_put_left:Nn  \@kernel@after@head  {\__tag_hook_kernel_after_head:}
     \tl_put_right:Nn \@kernel@before@foot {\__tag_hook_kernel_before_foot:}
     \tl_put_left:Nn  \@kernel@after@foot  {\__tag_hook_kernel_after_foot:}
   }
 }

\bool_new:N \g__tag_saved_in_mc_bool
\cs_new_protected:Npn \__tag_exclude_headfoot_begin:
 {
    \bool_set_false:N  \l__tag_para_bool
    \bool_if:NTF \g__tag_mode_lua_bool
     {
      \tag_mc_end_push:
     }
     {
       \bool_gset_eq:NN   \g__tag_saved_in_mc_bool \g__tag_in_mc_bool
       \bool_gset_false:N \g__tag_in_mc_bool
     }
    \tag_mc_begin:n {artifact}
 }
\cs_new_protected:Npn \__tag_exclude_headfoot_end:
```

```
{
   \tag_mc_end:
   \bool_if:NTF \g__tag_mode_lua_bool
    {
     \tag_mc_begin_pop:n{}
    }
    {
      \bool_gset_eq:NN \g__tag_in_mc_bool\g__tag_saved_in_mc_bool
    }
}
```

This version allows to use an Artifact structure

```
\__tag_attr_new_entry:nn {__tag/attr/pagination}{/O/Artifact/Type/Pagination}
\cs_new_protected:Npn \__tag_exclude_struct_headfoot_begin:n #1
 {
   \bool_set_false:N  \l__tag_para_bool
   \bool_if:NTF \g__tag_mode_lua_bool
    {
     \tag_mc_end_push:
    }
    {
      \bool_gset_eq:NN   \g__tag_saved_in_mc_bool \g__tag_in_mc_bool
      \bool_gset_false:N \g__tag_in_mc_bool
    }
   \tag_struct_begin:n{tag=Artifact,attribute-class=__tag/attr/#1}
   \tag_mc_begin:n {artifact=#1}
 }

\cs_new_protected:Npn \__tag_exclude_struct_headfoot_end:
 {
   \tag_mc_end:
   \tag_struct_end:
   \bool_if:NTF \g__tag_mode_lua_bool
    {
     \tag_mc_begin_pop:n{}
    }
    {
      \bool_gset_eq:NN \g__tag_in_mc_bool\g__tag_saved_in_mc_bool
    }
 }
```

And now the keys

exclude-header-footer␣(setup-key)

```
\keys_define:nn { __tag / setup }
  {
    exclude-header-footer .choice:,
    exclude-header-footer / true .code:n =
     {
       \cs_set_eq:NN \__tag_hook_kernel_before_head: \__tag_exclude_headfoot_begin:
       \cs_set_eq:NN \__tag_hook_kernel_before_foot: \__tag_exclude_headfoot_begin:
       \cs_set_eq:NN \__tag_hook_kernel_after_head:  \__tag_exclude_headfoot_end:
       \cs_set_eq:NN \__tag_hook_kernel_after_foot:  \__tag_exclude_headfoot_end:
     },
    exclude-header-footer / pagination .code:n =
```

```
    {
      \cs_set:Nn \__tag_hook_kernel_before_head: { \__tag_exclude_struct_headfoot_begin:n {pa
      \cs_set:Nn \__tag_hook_kernel_before_foot: { \__tag_exclude_struct_headfoot_begin:n {pa
      \cs_set_eq:NN \__tag_hook_kernel_after_head:  \__tag_exclude_struct_headfoot_end:
      \cs_set_eq:NN \__tag_hook_kernel_after_foot:  \__tag_exclude_struct_headfoot_end:
    },
   exclude-header-footer / false .code:n =
    {
      \cs_set_eq:NN \__tag_hook_kernel_before_head: \prg_do_nothing:
      \cs_set_eq:NN \__tag_hook_kernel_before_foot: \prg_do_nothing:
      \cs_set_eq:NN \__tag_hook_kernel_after_head:  \prg_do_nothing:
      \cs_set_eq:NN \__tag_hook_kernel_after_foot:  \prg_do_nothing:
    },
  exclude-header-footer .default:n = true,
  exclude-header-footer .initial:n = true
 }
```

(*End definition for* `exclude-header-footer (setup-key)`. *This function is documented on page* 34.)

## 11.6 Links

We need to close and reopen mc-chunks around links. Currently we handle URI and GoTo (internal) links. Links should have an alternative text in the Contents key. It is unclear which text this should be and how to get it.

```
\hook_gput_code:nnn
  {pdfannot/link/URI/before}
  {tagpdf}
  {
    \tag_mc_end_push:
    \tag_struct_begin:n { tag=Link }
    \tag_mc_begin:n { tag=Link }
    \pdfannot_dict_put:nnx
      { link/URI }
      { StructParent }
      { \tag_struct_parent_int: }
  }

\hook_gput_code:nnn
  {pdfannot/link/URI/after}
  {tagpdf}
  {
     \tag_struct_insert_annot:xx {\pdfannot_link_ref_last:}{\tag_struct_parent_int:}
     \tag_mc_end:
     \tag_struct_end:
     \tag_mc_begin_pop:n{}
  }

\hook_gput_code:nnn
  {pdfannot/link/GoTo/before}
  {tagpdf}
  {
     \tag_mc_end_push:
     \tag_struct_begin:n{tag=Link}
     \tag_mc_begin:n{tag=Link}
```

```
      \pdfannot_dict_put:nnx
        { link/GoTo }
        { StructParent }
        { \tag_struct_parent_int: }
  }

\hook_gput_code:nnn
  {pdfannot/link/GoTo/after}
  {tagpdf}
  {
    \tag_struct_insert_annot:xx {\pdfannot_link_ref_last:}{\tag_struct_parent_int:}
    \tag_mc_end:
    \tag_struct_end:
    \tag_mc_begin_pop:n{}

  }

% "alternative descriptions " for PAX3. How to get better text here??
\pdfannot_dict_put:nnn
 { link/URI }
 { Contents }
 { (url) }

\pdfannot_dict_put:nnn
 { link/GoTo }
 { Contents }
 { (ref) }

```

</package>

# Part III
# The tagpdf-tree module Commands trees and main dictionaries Part of the tagpdf package

```
⟨@@=tag⟩
⟨*header⟩
\ProvidesExplPackage {tagpdf-tree-code} {2022-08-24} {0.97}
 {part of tagpdf - code related to writing trees and dictionaries to the pdf}
⟨/header⟩
```

## 1 Trees, pdfmanagement and finalization code

The code to finish the structure is in a hook. This will perhaps at the end be a kernel hook. TODO check right place for the code The pdfmanagement code is the kernel hook after shipout/lastpage so all code affecting it should be before. Objects can be written later, at least in pdf mode.

```
⟨*package⟩
\hook_gput_code:nnn{begindocument}{tagpdf}
  {
    \bool_if:NT \g__tag_active_tree_bool
      {
        \sys_if_output_pdf:TF
          {
            \AddToHook{enddocument/end} { \__tag_finish_structure: }
          }
          {
            \AddToHook{shipout/lastpage} { \__tag_finish_structure: }
          }
      }
  }
```

### 1.1 Check structure

__tag_tree_final_checks:

```
\cs_new_protected:Npn \__tag_tree_final_checks:
 {
   \int_compare:nNnF {\seq_count:N\g__tag_struct_stack_seq}={1}
    {
      \msg_warning:nn {tag}{tree-struct-still-open}
      \int_step_inline:nnn{2}{\seq_count:N\g__tag_struct_stack_seq}
       {\tag_struct_end:}
    }
 }
```

(*End definition for* __tag_tree_final_checks:.)

## 1.2 Catalog: MarkInfo and StructTreeRoot

The StructTreeRoot and the MarkInfo entry must be added to the catalog. We do it late so that we can win, but before the pdfmanagement hook.

__tag/struct/0 This is the object for the root object, the StructTreeRoot

```
\pdf_object_new:n { __tag/struct/0 }
```

(*End definition for* __tag/struct/0.)

```
\hook_gput_code:nnn{shipout/lastpage}{tagpdf}
  {
    \bool_if:NT \g__tag_active_tree_bool
      {
        \pdfmanagement_add:nnn { Catalog / MarkInfo } { Marked } { true }
        \pdfmanagement_add:nnx
          { Catalog }
          { StructTreeRoot }
          { \pdf_object_ref:n { __tag/struct/0 } }
      }
  }
```

## 1.3 Writing structure elements

The following commands are needed to write out the structure.

__tag_tree_write_structtreeroot: This writes out the root object.

```
\pdf_version_compare:NnTF < {2.0}
 {
   \cs_new_protected:Npn \__tag_tree_write_structtreeroot:
     {
        \__tag_prop_gput:cnx
          { g__tag_struct_0_prop }
          { ParentTree }
          { \pdf_object_ref:n { __tag/tree/parenttree } }
        \__tag_prop_gput:cnx
          { g__tag_struct_0_prop }
          { RoleMap }
          { \pdf_object_ref:n { __tag/tree/rolemap } }
        \__tag_struct_write_obj:n { 0 }
     }
 }
```

no RoleMap in pdf 2.0

```
 {
   \cs_new_protected:Npn \__tag_tree_write_structtreeroot:
     {
        \__tag_prop_gput:cnx
          { g__tag_struct_0_prop }
          { ParentTree }
          { \pdf_object_ref:n { __tag/tree/parenttree } }
        \__tag_struct_write_obj:n { 0 }
     }
 }
```

(*End definition for* __tag_tree_write_structtreeroot:.)

__tag_tree_write_structelements: This writes out the other struct elems, the absolute number is in the counter.

```
\cs_new_protected:Npn \__tag_tree_write_structelements:
  {
    \int_step_inline:nnnn {1}{1}{\c@g__tag_struct_abs_int}
      {
        \__tag_struct_write_obj:n { ##1 }
      }
  }
```

(*End definition for* `\__tag_tree_write_structelements:`.)

## 1.4 ParentTree

__tag/tree/parenttree The object which will hold the parenttree

```
\pdf_object_new:n { __tag/tree/parenttree }
```

(*End definition for* `__tag/tree/parenttree`.)

The ParentTree maps numbers to objects or (if the number represents a page) to arrays of objects. The numbers refer to two dictinct types of entries: page streams and real objects like annotations. The numbers must be distinct and ordered. So we rely on abspage for the pages and put the real objects at the end. We use a counter to have a chance to get the correct number if code is processed twice.

\c@g__tag_parenttree_obj_int This is a counter for the real objects. It starts at the absolute last page value. It relies on l3ref.

```
\newcounter  { g__tag_parenttree_obj_int }
\hook_gput_code:nnn{begindocument}{tagpdf}
  {
    \int_gset:Nn
      \c@g__tag_parenttree_obj_int
      { \__tag_ref_value_lastpage:nn{abspage}{100}  }
  }
```

(*End definition for* `\c@g__tag_parenttree_obj_int`.)

We store the number/object references in a tl-var. If more structure is needed one could switch to a seq.

\g__tag_parenttree_objr_tl

```
\tl_new:N \g__tag_parenttree_objr_tl
```

(*End definition for* `\g__tag_parenttree_objr_tl`.)

__tag_parenttree_add_objr:nn This command stores a StructParent number and a objref into the tl var. This is only for objects like annotations, pages are handled elsewhere.

```
\cs_new_protected:Npn \__tag_parenttree_add_objr:nn #1 #2 %#1 StructParent number, #2 objref
  {
    \tl_gput_right:Nx \g__tag_parenttree_objr_tl
      {
        #1 \c_space_tl #2 ^^J
      }
  }
```

(*End definition for* `\__tag_parenttree_add_objr:nn`.)

\l__tag_parenttree_content_tl A tl-var which will get the page related parenttree content.

```
\tl_new:N \l__tag_parenttree_content_tl
```

(*End definition for* `\l__tag_parenttree_content_tl`.)

__tag_tree_fill_parenttree: This is the main command to assemble the page related entries of the parent tree. It wanders through the pages and the mcid numbers and collects all mcid of one page.

```
\cs_new_protected:Npn \__tag_tree_fill_parenttree:
  {
    \int_step_inline:nnnn{1}{1}{\__tag_ref_value_lastpage:nn{abspage}{-1}} %not quite clear if
      { %page ##1
        \prop_clear:N \l__tag_tmpa_prop
        \int_step_inline:nnnn{1}{1}{\__tag_ref_value_lastpage:nn{tagmcabs}{-1}}
          {
            %mcid####1
            \int_compare:nT
              {\__tag_ref_value:enn{mcid-####1}{tagabspage}{-1}=##1} %mcid is on current page
              {% yes
                \prop_put:Nxx
                  \l__tag_tmpa_prop
                  {\__tag_ref_value:enn{mcid-####1}{tagmcid}{-1}}
                  {\prop_item:Nn \g__tag_mc_parenttree_prop {####1}}
              }
          }
        \tl_put_right:Nx\l__tag_parenttree_content_tl
          {
            \int_eval:n {##1-1}\c_space_tl
            [\c_space_tl %]
          }
        \int_step_inline:nnnn
          {0}
          {1}
          { \prop_count:N \l__tag_tmpa_prop -1 }
          {
            \prop_get:NnNTF \l__tag_tmpa_prop {####1} \l__tag_tmpa_tl
              {% page#1:mcid##1:\l__tag_tmpa_tl :content
                \tl_put_right:Nx \l__tag_parenttree_content_tl
                  {
                    \pdf_object_if_exist:eT { __tag/struct/\l__tag_tmpa_tl }
                     {
                       \pdf_object_ref:e { __tag/struct/\l__tag_tmpa_tl }
                     }
                    \c_space_tl
                  }
              }
              {
                \msg_warning:nn { tag } {tree-mcid-index-wrong}
              }
          }
        \tl_put_right:Nn
          \l__tag_parenttree_content_tl
          {%[
            ]^^J
```

```
            }
        }
    }
```

(*End definition for* `\__tag_tree_fill_parenttree:`.)

`\__tag_tree_lua_fill_parenttree:` This is a special variant for luatex. lua mode must/can do it differently.

```
\cs_new_protected:Npn \__tag_tree_lua_fill_parenttree:
  {
    \tl_set:Nn \l__tag_parenttree_content_tl
      {
        \lua_now:e
          {
            ltx.__tag.func.output_parenttree
              (
                \int_use:N\g_shipout_readonly_int
              )
          }
      }
  }
```

(*End definition for* `\__tag_tree_lua_fill_parenttree:`.)

`\__tag_tree_write_parenttree:` This combines the two parts and writes out the object. TODO should the check for lua be moved into the backend code?

```
\cs_new_protected:Npn \__tag_tree_write_parenttree:
  {
    \bool_if:NTF \g__tag_mode_lua_bool
      {
        \__tag_tree_lua_fill_parenttree:
      }
      {
        \__tag_tree_fill_parenttree:
      }
    \tl_put_right:NV \l__tag_parenttree_content_tl\g__tag_parenttree_objr_tl
    \pdf_object_write:nnx  { __tag/tree/parenttree }{dict}
      {
        /Nums\c_space_tl [\l__tag_parenttree_content_tl]
      }
  }
```

(*End definition for* `\__tag_tree_write_parenttree:`.)

## 1.5 Rolemap dictionary

The Rolemap dictionary describes relations between new tags and standard types. The main part here is handled in the role module, here we only define the command which writes it to the PDF.

`__tag/tree/rolemap` At first we reserve again an object.

```
\pdf_version_compare:NnT < {2.0}
  {
    \pdf_object_new:n { __tag/tree/rolemap }
  }
```

(*End definition for* `__tag/tree/rolemap`.)

`\__tag_tree_write_rolemap:` This writes out the rolemap, basically it simply pushes out the dictionary which has been filled in the role module.

```
\pdf_version_compare:NnTF < {2.0}
  {
   \cs_new_protected:Npn \__tag_tree_write_rolemap:
    {
      \prop_map_inline:Nn\g__tag_role_rolemap_prop
        {
          \pdfdict_gput:nnx {g__tag_role/RoleMap_dict}
            {##1}
            {\pdf_name_from_unicode_e:n{##2}}
        }
      \pdf_object_write:nnx  { __tag/tree/rolemap }{dict}
       {
        \pdfdict_use:n{g__tag_role/RoleMap_dict}
       }
    }
  }
  {
    \cs_new_protected:Npn \__tag_tree_write_rolemap:{}
  }

```

(*End definition for* `\__tag_tree_write_rolemap:`.)

## 1.6 Classmap dictionary

Classmap and attributes are setup in the struct module, here is only the code to write it out. It should only done if values have been used.

`\__tag_tree_write_classmap:`

```
\cs_new_protected:Npn \__tag_tree_write_classmap:
  {
    \tl_clear:N \l__tag_tmpa_tl
    \seq_gremove_duplicates:N \g__tag_attr_class_used_seq
    \seq_set_map:NNn \l__tag_tmpa_seq \g__tag_attr_class_used_seq
      {
        ##1\c_space_tl
        <<
          \prop_item:Nn
            \g__tag_attr_entries_prop
            {##1}
        >>
      }
    \tl_set:Nx \l__tag_tmpa_tl
      {
        \seq_use:Nn
          \l__tag_tmpa_seq
          { \iow_newline: }
      }
    \tl_if_empty:NF
      \l__tag_tmpa_tl
```

```
    {
      \pdf_object_new:n { __tag/tree/classmap }
      \pdf_object_write:nnx
        { __tag/tree/classmap }
        {dict}
        { \l__tag_tmpa_tl }
      \__tag_prop_gput:cnx
        { g__tag_struct_0_prop }
        { ClassMap }
        { \pdf_object_ref:n { __tag/tree/classmap }  }
    }
}
```

(*End definition for* `\__tag_tree_write_classmap:`.)

## 1.7 Namespaces

Namespaces are handle in the role module, here is the code to write them out. Namespaces are only relevant for pdf2.0.

`__tag/tree/namespaces`

```
\pdf_object_new:n { __tag/tree/namespaces }
```

(*End definition for* `__tag/tree/namespaces`.)

`\__tag_tree_write_namespaces:`

```
\cs_new_protected:Npn \__tag_tree_write_namespaces:
  {
   \pdf_version_compare:NnF < {2.0}
    {
      \prop_map_inline:Nn \g__tag_role_NS_prop
        {
          \pdfdict_if_empty:nF {g__tag_role/RoleMapNS_##1_dict}
            {
              \pdf_object_write:nnx {__tag/RoleMapNS/##1}{dict}
                {
                  \pdfdict_use:n {g__tag_role/RoleMapNS_##1_dict}
                }
              \pdfdict_gput:nnx{g__tag_role/Namespace_##1_dict}
                {RoleMapNS}{\pdf_object_ref:n {__tag/RoleMapNS/##1}}
            }
          \pdf_object_write:nnx{tag/NS/##1}{dict}
            {
               \pdfdict_use:n {g__tag_role/Namespace_##1_dict}
            }
        }
      \pdf_object_write:nnx {__tag/tree/namespaces}{array}
        {
          \prop_map_tokens:Nn \g__tag_role_NS_prop{\use_ii:nn}
        }
    }
  }
```

(*End definition for* `\__tag_tree_write_namespaces:`.)

## 1.8 Finishing the structure

This assembles the various parts. TODO (when tabular are done or if someone requests it): IDTree

__tag_finish_structure:

```
\hook_new:n {tagpdf/finish/before}
\cs_new_protected:Npn \__tag_finish_structure:
  {
    \bool_if:NT\g__tag_active_tree_bool
      {
        \hook_use:n {tagpdf/finish/before}
        \__tag_tree_final_checks:
        \__tag_tree_write_parenttree:
        \__tag_tree_write_rolemap:
        \__tag_tree_write_classmap:
        \__tag_tree_write_namespaces:
        \__tag_tree_write_structelements: %this is rather slow!!
        \__tag_tree_write_structtreeroot:
      }
  }
```

(*End definition for* `\__tag_finish_structure:`.)

## 1.9 StructParents entry for Page

We need to add to the Page resources the `StructParents` entry, this is simply the absolute page number.

```
\hook_gput_code:nnn{begindocument}{tagpdf}
  {
    \bool_if:NT\g__tag_active_tree_bool
      {
       \hook_gput_code:nnn{shipout/before} { tagpdf/structparents }
         {
           \pdfmanagement_add:nnx
             { Page }
             { StructParents }
             { \int_eval:n { \g_shipout_readonly_int} }
         }
      }
  }
⟨/package⟩
```

# Part IV
# The tagpdf-mc-shared module
# Code related to Marked Content (mc-chunks), code shared by all modes
# Part of the tagpdf package

## 1 Public Commands

\tag_mc_begin:n
\tag_mc_end:

\tag_mc_begin:n{⟨*key-values*⟩}
\tag_mc_end:

These commands insert the end code of the marked content. They don't end a group and in generic mode it doesn't matter if they are in another group as the starting commands. In generic mode both commands check if they are correctly nested and issue a warning if not.

\tag_mc_use:n

\tag_mc_use:n{⟨*label*⟩}

These command allow to record a marked content that was stashed away before into the current structure. A marked content can be used only once – the command will issue a warning if an mc is use a second time.

\tag_mc_artifact_group_begin:n
\tag_mc_artifact_group_end:

\tag_mc_artifact_group_begin:n {⟨*name*⟩}
\tag_mc_artifact_group_end:

New: 2019-11-20

This command pair creates a group with an artifact marker at the begin and the end. Inside the group the tagging commands are disabled. It allows to mark a complete region as artifact without having to worry about user commands with tagging commands. ⟨*name*⟩ should be a value allowed also for the `artifact` key. It pushes and pops mc-chunks at the begin and end. TODO: document is in tagpdf.tex

\tag_mc_end_push:
\tag_mc_begin_pop:n

\tag_mc_end_push:
\tag_mc_begin_pop:n{⟨*key-values*⟩}

New: 2021-04-22

If there is an open mc chunk, `\tag_mc_end_push:` ends it and pushes its tag of the (global) stack. If there is no open chunk, it puts −1 on the stack (for debugging) `\tag_mc_begin_pop:n` removes a value from the stack. If it is different from −1 it opens a tag with it. The reopened mc chunk looses info like the alt text for now.

\tag_mc_if_in_p: ⋆
\tag_mc_if_in:*TF* ⋆

\tag_mc_if_in:TF {⟨*true code*⟩} {⟨*false code*⟩}

Determines if a mc-chunk is open.

## 2 Public keys

The following keys can be used with `\tag_mc_begin:n`, `\tagmcbegin`, `\tag_mc_begin_pop:n`,

`tag␣(mc-key)` This key is required, unless artifact is used. The value is a tag like `P` or `H1` without a slash at the begin, this is added by the code. It is possible to setup new tags. The value of the key is expanded, so it can be a command. The expansion is passed unchanged to the PDF, so it should with a starting slash give a valid PDF name (some ascii with numbers like `H4` is fine).

`artifact␣(mc-key)` This will setup the marked content as an artifact. The key should be used for content that should be ignored. The key can take one of the values `pagination`, `layout`, `page`, `background` and `notype` (this is the default).

`raw␣(mc-key)` This key allows to add more entries to the properties dictionary. The value must be correct, low-level PDF. E.g. `raw=/Alt (Hello)` will insert an alternative Text.

`alt␣(mc-key)` This key inserts an `/Alt` value in the property dictionary of the BDC operator. The value is handled as verbatim string, commands are not expanded. The value will be expanded first once.

`actualtext␣(mc-key)` This key inserts an `/ActualText` value in the property dictionary of the BDC operator. The value is handled as verbatim string, commands are not expanded. The value will be expanded first once.

`label␣(mc-key)` This key sets a label by which one can call the marked content later in another structure (if it has been stashed with the `stash` key). Internally the label name will start with `tagpdf-`.

`stash␣(mc-key)` This "stashes" an mc-chunk: it is not inserted into the current structure. It should be normally be used along with a label to be able to use the mc-chunk in another place.

The code is splitted into three parts: code shared by all engines, code specific to luamode and code not used by luamode.

## 3 Marked content code – shared

```
⟨@@=tag⟩
⟨*header⟩
\ProvidesExplPackage {tagpdf-mc-code-shared} {2022-08-24} {0.97}
  {part of tagpdf - code related to marking chunks -
   code shared by generic and luamode }
⟨/header⟩
```

## 3.1 Variables and counters

MC chunks must be counted. I use a latex counter for the absolute count, so that it is added to `\cl@@ckpt` and restored e.g. in tabulars and align. `\int_new:N  \c@g_@@_MCID_int` and `\tl_put_right:Nn\cl@@ckpt{\@elt{g_uf_test_int}}` would work too, but as the name is not expl3 then too, why bother? The absolute counter can be used to label and to check if the page counter needs a reset.

`g__tag_MCID_abs_int`

```
⟨*shared⟩
\newcounter { g__tag_MCID_abs_int }
```

(*End definition for* `g__tag_MCID_abs_int`.)

`\__tag_get_mc_abs_cnt:` A (expandable) function to get the current value of the cnt.

```
\cs_new:Npn \__tag_get_mc_abs_cnt: { \int_use:N \c@g__tag_MCID_abs_int }
```

(*End definition for* `\__tag_get_mc_abs_cnt:`.)

`\g__tag_MCID_tmp_bypage_int` The following hold the temporary by page number assigned to a mc. It must be defined in the shared code to avoid problems with labels.

```
\int_new:N \g__tag_MCID_tmp_bypage_int
```

(*End definition for* `\g__tag_MCID_tmp_bypage_int`.)

`\g__tag_in_mc_bool` This booleans record if a mc is open, to test nesting.

```
\bool_new:N \g__tag_in_mc_bool
```

(*End definition for* `\g__tag_in_mc_bool`.)

`\g__tag_mc_parenttree_prop` For every chunk we need to know the structure it is in, to record this in the parent tree. We store this in a property.
key: absolute number of the mc (tagmcabs)
value: the structure number the mc is in

```
\__tag_prop_new:N \g__tag_mc_parenttree_prop
```

(*End definition for* `\g__tag_mc_parenttree_prop`.)

`\g__tag_mc_parenttree_prop` Some commands (e.g. links) want to close a previous mc and reopen it after they did their work. For this we create a stack:

```
\seq_new:N \g__tag_mc_stack_seq
```

(*End definition for* `\g__tag_mc_parenttree_prop`.)

`\l__tag_mc_artifact_type_tl` Artifacts can have various types like Pagination or Layout. This stored in this variable.

```
\tl_new:N \l__tag_mc_artifact_type_tl
```

(*End definition for* `\l__tag_mc_artifact_type_tl`.)

`\l__tag_mc_key_stash_bool` `\l__tag_mc_artifact_bool` This booleans store the stash and artifact status of the mc-chunk.

```
\bool_new:N \l__tag_mc_key_stash_bool
\bool_new:N \l__tag_mc_artifact_bool
```

(*End definition for* `\l__tag_mc_key_stash_bool` *and* `\l__tag_mc_artifact_bool`.)

\l__tag_mc_key_tag_tl
\g__tag_mc_key_tag_tl
\l__tag_mc_key_label_tl
\l__tag_mc_key_properties_tl

Variables used by the keys. `\l_@@_mc_key_properties_tl` will collect a number of values. TODO: should this be a pdfdict now?

```
\tl_new:N \l__tag_mc_key_tag_tl
\tl_new:N \g__tag_mc_key_tag_tl
\tl_new:N \l__tag_mc_key_label_tl
\tl_new:N \l__tag_mc_key_properties_tl
```

(*End definition for* `\l__tag_mc_key_tag_tl` *and others.*)

## 3.2 Functions

__tag_mc_handle_mc_label:n

The commands labels a mc-chunk. It is used if the user explicitly labels the mc-chunk with the `label` key. The argument is the value provided by the user. It stores the attributes
`tagabspage`: the absolute page, `\g_shipout_readonly_int`,
`tagmcabs`: the absolute mc-counter `\c@g_@@_MCID_abs_int`,
`tagmcid`: the ID of the chunk on the page `\g_@@_MCID_tmp_bypage_int`, this typically settles down after a second compilation. The reference command is defined in tagpdf.dtx and is based on l3ref.

```
\cs_new:Nn \__tag_mc_handle_mc_label:n
  {
    \__tag_ref_label:en{tagpdf-#1}{mc}
  }
```

(*End definition for* `\__tag_mc_handle_mc_label:n`.)

__tag_mc_set_label_used:n

Unlike with structures we can't check if a labeled mc has been used by looking at the P key, so we use a dedicated csname for the test

```
\cs_new_protected:Npn \__tag_mc_set_label_used:n #1 %#1 labelname
  {
    \tl_new:c { g__tag_mc_label_\tl_to_str:n{#1}_used_tl }
  }
⟨/shared⟩
```

(*End definition for* `\__tag_mc_set_label_used:n`.)

\tag_mc_use:n

These command allow to record a marked content that was stashed away before into the current structure. A marked content can be used only once – the command will issue a warning if an mc is use a second time. The argument is a label name set with the `label` key.

TODO: is testing for struct the right test?

```
⟨base⟩\cs_new_protected:Npn \tag_mc_use:n #1 { \__tag_whatsits: }
⟨*shared⟩
\cs_set_protected:Npn \tag_mc_use:n #1 %#1: label name
  {
    \__tag_check_if_active_struct:T
      {
        \tl_set:Nx  \l__tag_tmpa_tl { \__tag_ref_value:nnn{tagpdf-#1}{tagmcabs}{} }
        \tl_if_empty:NTF\l__tag_tmpa_tl
          {
            \msg_warning:nnn {tag} {mc-label-unknown} {#1}
          }
          {
```

```
            \cs_if_free:cTF { g__tag_mc_label_\tl_to_str:n{#1}_used_tl }
              {
                \__tag_mc_handle_stash:x { \l__tag_tmpa_tl }
                \__tag_mc_set_label_used:n {#1}
              }
              {
                 \msg_warning:nnn {tag}{mc-used-twice}{#1}
              }
          }
      }
  }
⟨/shared⟩
```

(*End definition for* `\tag_mc_use:n`*. This function is documented on page 55.*)

`\tag_mc_artifact_group_begin:n`
`\tag_mc_artifact_group_end:`

This opens an artifact of the type given in the argument, and then stops all tagging. It creates a group. It pushes and pops mc-chunks at the begin and end.

```
⟨base⟩\cs_new_protected:Npn \tag_mc_artifact_group_begin:n #1 {}
⟨base⟩\cs_new_protected:Npn \tag_mc_artifact_group_end:{}
⟨*shared⟩
\cs_set_protected:Npn \tag_mc_artifact_group_begin:n #1
 {
  \tag_mc_end_push:
  \tag_mc_begin:n {artifact=#1}
  \tag_stop_group_begin:
 }

\cs_set_protected:Npn \tag_mc_artifact_group_end:
 {
  \tag_stop_group_end:
  \tag_mc_end:
  \tag_mc_begin_pop:n{}
 }
⟨/shared⟩
```

(*End definition for* `\tag_mc_artifact_group_begin:n` *and* `\tag_mc_artifact_group_end:`*. These functions are documented on page 55.*)

`\tag_mc_end_push:`
`\tag_mc_begin_pop:n`

```
⟨base⟩\cs_new_protected:Npn \tag_mc_end_push: {}
⟨base⟩\cs_new_protected:Npn \tag_mc_begin_pop:n #1 {}
⟨*shared⟩
\cs_set_protected:Npn \tag_mc_end_push:
  {
    \__tag_check_if_active_mc:T
      {
        \__tag_mc_if_in:TF
          {
            \seq_gpush:Nx \g__tag_mc_stack_seq { \tag_get:n {mc_tag} }
            \__tag_check_mc_pushed_popped:nn
              { pushed }
              { \tag_get:n {mc_tag} }
            \tag_mc_end:
          }
          {
```

```
            \seq_gpush:Nn \g__tag_mc_stack_seq {-1}
            \__tag_check_mc_pushed_popped:nn { pushed }{-1}
          }
      }
  }

\cs_set_protected:Npn \tag_mc_begin_pop:n #1
  {
    \__tag_check_if_active_mc:T
      {
        \seq_gpop:NNTF \g__tag_mc_stack_seq \l__tag_tmpa_tl
          {
            \tl_if_eq:NnTF \l__tag_tmpa_tl {-1}
              {
                \__tag_check_mc_pushed_popped:nn {popped}{-1}
              }
              {
                \__tag_check_mc_pushed_popped:nn {popped}{\l__tag_tmpa_tl}
                \tag_mc_begin:n {tag=\l__tag_tmpa_tl,#1}
              }
          }
          {
            \__tag_check_mc_pushed_popped:nn {popped}{empty~stack,~nothing}
          }
      }
  }
```

(*End definition for* `\tag_mc_end_push:` *and* `\tag_mc_begin_pop:n`*. These functions are documented on page 55.*)

## 3.3 Keys

This are the keys where the code can be shared between the modes.

`stash␣(mc-key)`
`__artifact-bool`
`__artifact-type`

the two internal artifact keys are use to define the public `artifact`. For now we add support for the subtypes Header and Footer. Watermark,PageNum, LineNum,Redaction,Bates will be added if some use case emerges. If some use case for /BBox and /Attached emerges, it will be perhaps necessary to adapt the code.

```
\keys_define:nn { __tag / mc }
  {
    stash                    .bool_set:N    = \l__tag_mc_key_stash_bool,
    __artifact-bool          .bool_set:N    = \l__tag_mc_artifact_bool,
    __artifact-type          .choice:,
    __artifact-type / pagination .code:n    =
      {
        \tl_set:Nn \l__tag_mc_artifact_type_tl { Pagination }
      },
    __artifact-type / pagination/header .code:n    =
      {
        \tl_set:Nn \l__tag_mc_artifact_type_tl { Pagination/Subtype/Header }
      },
    __artifact-type / pagination/footer .code:n    =
      {
        \tl_set:Nn \l__tag_mc_artifact_type_tl { Pagination/Subtype/Footer }
```

```
    },
  __artifact-type / layout     .code:n    =
    {
      \tl_set:Nn \l__tag_mc_artifact_type_tl { Layout }
    },
  __artifact-type / page       .code:n    =
    {
      \tl_set:Nn \l__tag_mc_artifact_type_tl { Page }
    },
  __artifact-type / background .code:n    =
    {
      \tl_set:Nn \l__tag_mc_artifact_type_tl { Background }
    },
  __artifact-type / notype     .code:n    =
    {
      \tl_set:Nn \l__tag_mc_artifact_type_tl {}
    },
  __artifact-type /      .code:n    =
    {
      \tl_set:Nn \l__tag_mc_artifact_type_tl {}
    },
}
```

(*End definition for* `stash (mc-key)`, `__artifact-bool`, *and* `__artifact-type`. *This function is documented on page 56.*)

⟨/shared⟩

# Part V
# The tagpdf-mc-generic module Code related to Marked Content (mc-chunks), generic mode Part of the tagpdf package

## 1 Marked content code – generic mode

```
⟨@@=tag⟩
⟨*generic⟩
\ProvidesExplPackage {tagpdf-mc-code-generic} {2022-08-24} {0.97}
 {part of tagpdf - code related to marking chunks - generic mode}
⟨/generic⟩
⟨*debug⟩
\ProvidesExplPackage {tagpdf-debug-generic} {2022-08-24} {0.97}
 {part of tagpdf - debugging code related to marking chunks - generic mode}
⟨/debug⟩
```

### 1.1 Variables

\g__tag_MCID_byabspage_prop

This property will hold the current maximum on a page it will contain key-value of type ⟨*abspagenum*⟩=⟨*max mcid*⟩

```
⟨*generic⟩
\__tag_prop_new:N \g__tag_MCID_byabspage_prop
```

(*End definition for* `\g__tag_MCID_byabspage_prop`.)

\l__tag_mc_ref_abspage_tl

We need a ref-label system to ensure that the MCID cnt restarts at 0 on a new page This will be used to store the tagabspage attribute retrieved from a label.

```
\tl_new:N \l__tag_mc_ref_abspage_tl
```

(*End definition for* `\l__tag_mc_ref_abspage_tl`.)

\l__tag_mc_tmpa_tl

temporary variable

```
\tl_new:N \l__tag_mc_tmpa_tl
```

(*End definition for* `\l__tag_mc_tmpa_tl`.)

\g__tag_mc_marks

a marks register to keep track of the mc's at page breaks and a sequence to keep track of the data for the continuation extra-tmb. We probably will need to track mc-marks in more than one stream, so the seq contains the name of the stream.

```
\newmarks  \g__tag_mc_marks
```

(*End definition for* `\g__tag_mc_marks`.)

\g__tag_mc_main_marks_seq
\g__tag_mc_footnote_marks_seq
\g__tag_mc_multicol_marks_seq

Each stream has an associated global seq variable holding the bottom marks from the/a previous chunk in the stream. We provide three by default: main, footnote and multicol. TODO: perhaps an interface for more streams will be needed.

```
\seq_new:N \g__tag_mc_main_marks_seq
\seq_new:N \g__tag_mc_footnote_marks_seq
\seq_new:N \g__tag_mc_multicol_marks_seq
```

(*End definition for* `\g__tag_mc_main_marks_seq`, `\g__tag_mc_footnote_marks_seq`, *and* `\g__tag_mc_multicol_marks_seq`.)

\l__tag_mc_firstmarks_seq
\l__tag_mc_botmarks_seq

The marks content contains a number of data which we will have to access and compare, so we will store it locally in two sequences. topmarks is unusable in LaTeX so we ignore it.

```
\seq_new:N  \l__tag_mc_firstmarks_seq
\seq_new:N  \l__tag_mc_botmarks_seq
```

(*End definition for* `\l__tag_mc_firstmarks_seq` *and* `\l__tag_mc_botmarks_seq`.)

## 1.2 Functions

__tag_mc_begin_marks:nn
__tag_mc_artifact_begin_marks:n
__tag_mc_end_marks:

Generic mode need to set marks for the page break and split stream handling. We always set two marks to be able to detect the case when no mark is on a page/galley. MC-begin commands will set (b,-,data) and (b,+,data), MC-end commands will set (e,-,data) and (e,+,data).

```
\cs_new_protected:Npn \__tag_mc_begin_marks:nn #1 #2 %#1 tag, #2 label
  {
    \tex_marks:D \g__tag_mc_marks
      {
        b-, %first of begin pair
        \int_use:N\c@g__tag_MCID_abs_int, %mc-num
        \g__tag_struct_stack_current_tl,  %structure num
        #1, %tag
        \bool_if:NT \l__tag_mc_key_stash_bool{stash}, % stash info
        #2, %label
      }
    \tex_marks:D \g__tag_mc_marks
      {
        b+, % second of begin pair
        \int_use:N\c@g__tag_MCID_abs_int, %mc-num
        \g__tag_struct_stack_current_tl,  %structure num
        #1, %tag
        \bool_if:NT \l__tag_mc_key_stash_bool{stash}, % stash info
        #2, %label
      }
  }
\cs_generate_variant:Nn \__tag_mc_begin_marks:nn {oo}
\cs_new_protected:Npn \__tag_mc_artifact_begin_marks:n #1 %#1 type
  {
    \tex_marks:D \g__tag_mc_marks
      {
        b-, %first of begin pair
        \int_use:N\c@g__tag_MCID_abs_int, %mc-num
        -1, %structure num
```

```
        #1 %type
      }
    \tex_marks:D \g__tag_mc_marks
      {
        b+, %first of begin pair
        \int_use:N\c@g__tag_MCID_abs_int, %mc-num
        -1,  %structure num
        #1  %Type
      }
  }

\cs_new_protected:Npn \__tag_mc_end_marks:
  {
    \tex_marks:D \g__tag_mc_marks
      {
        e-, %first of end pair
        \int_use:N\c@g__tag_MCID_abs_int, %mc-num
        \g__tag_struct_stack_current_tl,  %structure num
      }
    \tex_marks:D \g__tag_mc_marks
      {
        e+, %second of end pair
        \int_use:N\c@g__tag_MCID_abs_int, %mc-num
        \g__tag_struct_stack_current_tl,  %structure num
      }
  }
```

(*End definition for* `\__tag_mc_begin_marks:nn`, `\__tag_mc_artifact_begin_marks:n`, *and* `\__tag_mc_end_marks:`.)

`\__tag_mc_disable_marks:` This disables the marks. They can't be reenabled, so it should only be used in groups.

```
\cs_new_protected:Npn \__tag_mc_disable_marks:
 {
   \cs_set_eq:NN \__tag_mc_begin_marks:nn \use_none:nn
   \cs_set_eq:NN \__tag_mc_artifact_begin_marks:n \use_none:n
   \cs_set_eq:NN \__tag_mc_end_marks: \prg_do_nothing:
 }
```

(*End definition for* `\__tag_mc_disable_marks:`.)

`\__tag_mc_get_marks:` This stores the current content of the marks in the sequences. It naturally should only be used in places where it makes sense.

```
\cs_new_protected:Npn \__tag_mc_get_marks:
 {
   \exp_args:NNx
   \seq_set_from_clist:Nn \l__tag_mc_firstmarks_seq
     { \tex_firstmarks:D \g__tag_mc_marks }
   \exp_args:NNx
   \seq_set_from_clist:Nn \l__tag_mc_botmarks_seq
     { \tex_botmarks:D   \g__tag_mc_marks }
 }
```

(*End definition for* `\__tag_mc_get_marks:`.)

__tag_mc_store:nnn

This inserts the mc-chunk ⟨*mc-num*⟩ into the structure struct-num after the ⟨*mc-prev*⟩. The structure must already exist. The additional mcid dictionary is stored in a property. The item is retrieved when the kid entry is built. We test if there is already an addition and append if needed.

```
\cs_new_protected:Npn \__tag_mc_store:nnn #1 #2 #3 %#1 mc-prev, #2 mc-num #3 structure-
num
  {
    %\prop_show:N \g__tag_struct_cont_mc_prop
    \prop_get:NnNTF \g__tag_struct_cont_mc_prop {#1} \l__tag_tmpa_tl
      {
        \prop_gput:Nnx \g__tag_struct_cont_mc_prop {#1}{ \l__tag_tmpa_tl \__tag_struct_mcid_di
      }
      {
        \prop_gput:Nnx \g__tag_struct_cont_mc_prop {#1}{ \__tag_struct_mcid_dict:n {#2}}
      }
    \prop_gput:Nxx \g__tag_mc_parenttree_prop
      {#2}
      {#3}
  }
\cs_generate_variant:Nn \__tag_mc_store:nnn {xxx}
```

(*End definition for* `\__tag_mc_store:nnn`.)

__tag_mc_insert_extra_tmb:n
__tag_mc_insert_extra_tme:n

These two functions should be used in the output routine at the place where a mc-literal could be missing due to a page break or some other split. They check (with the help of the marks) if a extra-tmb or extra-tme is needed. The tmb command stores also the mc into the structure, the tme has to store the data for a following extra-tmb. The argument takes a stream name like main or footnote to allow different handling there. The content of the marks must be stored before (with `\@@_mc_get_marks:` or manually) into `\l_@@_mc_firstmarks_seq` and `\l_@@_mc_botmarks_seq` so that the tests can use them.

```
\cs_new_protected:Npn \__tag_mc_insert_extra_tmb:n #1 % #1 stream: e.g. main or footnote
  {
     \__tag_check_typeout_v:n {=>~ first~ \seq_use:Nn \l__tag_mc_firstmarks_seq {,~}}
     \__tag_check_typeout_v:n {=>~ bot~ \seq_use:Nn \l__tag_mc_botmarks_seq {,~}}
     \__tag_check_if_mc_tmb_missing:TF
       {
         \__tag_check_typeout_v:n {=>~ TMB~ ~ missing~ ---~ inserted}
         %test if artifact
         \int_compare:nNnTF { \seq_item:cn { g__tag_mc_#1_marks_seq } {3} } = {-
1}
           {
              \tl_set:Nx \l__tag_tmpa_tl { \seq_item:cn { g__tag_mc_#1_marks_seq } {4} }
              \__tag_mc_handle_artifact:N \l__tag_tmpa_tl
           }
           {
              \exp_args:Nx
              \__tag_mc_bdc_mcid:n
                {
                  \seq_item:cn { g__tag_mc_#1_marks_seq } {4}
                }
              \str_if_eq:eeTF
                {
```

```
                  \seq_item:cn { g__tag_mc_#1_marks_seq } {5}
                }
                {}
                {
                  %store

 }
```

(*End definition for* `\__tag_mc_insert_extra_tmb:n` *and* `\__tag_mc_insert_extra_tme:n`.)

## 1.3 Looking at MC marks in boxes

`\__tag_add_missing_mcs:Nn`

Assumptions:

- test for tagging active outside;
- mark retrieval also outside.

This takes a box register as its first argument (or the register number in a count register, as used by multicol). It adds an extra tmb at the top of the box if necessary and similarly an extra tme at the end. This is done by adding hboxes in a way that the positioning and the baseline of the given box is not altered. The result is written back to the box.

The second argument is the stream this box belongs to und is currently either `main` for the main galley, `footnote` for footnote note text, or `multicol` for boxes produced for columns in that environment. Other streams may follow over time.

```
\cs_new_protected:Npn\__tag_add_missing_mcs:Nn #1 #2 {
  \vbadness \@M
  \vfuzz    \c_max_dim
  \vbox_set_to_ht:Nnn #1 { \box_ht:N #1 } {
    \hbox_set:Nn \l__tag_tmpa_box { \__tag_mc_insert_extra_tmb:n {#2} }
    \hbox_set:Nn \l__tag_tmpb_box { \__tag_mc_insert_extra_tme:n {#2} }
    \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
         {
           \seq_log:c { g__tag_mc_#2_marks_seq}
         }
```

The box placed on the top gets zero size and thus will not affect the box dimensions of the box we are modifying.

```
    \box_set_ht:Nn \l__tag_tmpa_box \c_zero_dim
    \box_set_dp:Nn \l__tag_tmpa_box \c_zero_dim
```

The box added at the bottom will get the depth of the original box. This way we can arrange that from the outside everything looks as before.

```
    \box_set_ht:Nn \l__tag_tmpb_box \c_zero_dim
    \box_set_dp:Nn \l__tag_tmpb_box { \box_dp:N #1 }
```

We need to set `\boxmaxdepth` in case the original box has an unusually large depth, otherwise that depth is not preserved when we string things together.

```
    \boxmaxdepth \@maxdepth
    \box_use_drop:N        \l__tag_tmpa_box
    \vbox_unpack_drop:N     #1
```

Back up by the depth of the box as we add that later again.

```
    \tex_kern:D -\box_dp:N \l__tag_tmpb_box
```

And we don't want any glue added when we add the box.

```
    \nointerlineskip
    \box_use_drop:N \l__tag_tmpb_box
  }
}
```

(*End definition for* `\__tag_add_missing_mcs:Nn`.)

`\__tag_add_missing_mcs_to_stream:Nn` This is the main command to add mc to the stream. It is therefor guarded by the mc-boolean.

If we aren't in the main stream then processing is a bit more complicated because to get at the marks in the box we need to artifically split it and then look at the split marks.

First argument is the box to update and the second is the "stream". In lua mode the command is a no-op.

```
\cs_new_protected:Npn \__tag_add_missing_mcs_to_stream:Nn #1#2
  {
    \__tag_check_if_active_mc:T {
```

First set up a temp box for trial splitting.

```
    \vbadness\maxdimen
    \box_set_eq:NN \l__tag_tmpa_box #1
```

Split the box to the largest size available. This should give us all content (but to be sure that there is no issue we could test out test box is empty now (not done).

```
    \vbox_set_split_to_ht:NNn \l__tag_tmpa_box \l__tag_tmpa_box \c_max_dim
```

As a side effect of this split we should now have the first and bottom split marks set up. We use this to set up `\l__tag_mc_firstmarks_seq`

```
    \exp_args:NNx
    \seq_set_from_clist:Nn \l__tag_mc_firstmarks_seq
        { \tex_splitfirstmarks:D \g__tag_mc_marks }
```

Some debugging info:

```
%    \iow_term:n { First~ mark~ from~ this~ box: }
%    \seq_log:N \l__tag_mc_firstmarks_seq
```

If this mark was empty then clearly the bottom mark will too be empty. Thus in this case we make use of the saved bot mark from the previous chunk. Note that if this is the first chunk in the stream the global seq would contain a random value, but then we can't end in this branch because the basis assumption is that streams are properly marked up so the first chunk would always have a mark at the beginning!

```
    \seq_if_empty:NTF \l__tag_mc_firstmarks_seq
      {
        \__tag_check_typeout_v:n
          {
            No~ marks~ so~ use~ saved~ bot~ mark:~
            \seq_use:cn {g__tag_mc_#2_marks_seq} {,~} \iow_newline:
          }
         \seq_set_eq:Nc \l__tag_mc_firstmarks_seq {g__tag_mc_#2_marks_seq}
```

We also update the bot mark to the same value so that we can later apply `\__tag_add_missing_mcs:Nn` with the data structures in place (see assumptions made there).

```
          \seq_set_eq:NN \l__tag_mc_botmarks_seq \l__tag_mc_firstmarks_seq
      }
```

If there was a first mark then there is also a bot mark (and it can't be the same as our marks always come in pairs). So if that branch is chosen we update `\l__tag_mc_botmarks_seq` from the bot mark.

```
      {
        \__tag_check_typeout_v:n
          {
            Pick~ up~ new~ bot~ mark!
          }
        \exp_args:NNx
        \seq_set_from_clist:Nn \l__tag_mc_botmarks_seq
            { \tex_splitbotmarks:D   \g__tag_mc_marks }
      }
```

Finally we call `\__tag_add_missing_mcs:Nn` to add any missing tmb/tme as needed,

```
    \__tag_add_missing_mcs:Nn #1 {#2}
%%
    \seq_gset_eq:cN  {g__tag_mc_#2_marks_seq} \l__tag_mc_botmarks_seq
%%
  }
}
```

(*End definition for* `\__tag_add_missing_mcs_to_stream:Nn`.)

__tag_mc_if_in_p:
__tag_mc_if_in:TF
\tag_mc_if_in_p:
\tag_mc_if_in:TF

This is a test if a mc is open or not. It depends simply on a global boolean: mc-chunks are added linearly so nesting should not be relevant.

One exception are header and footer (perhaps they are more, but for now it doesn't seem so, so there are no dedicated code to handle this situation): When they are built and added to the page we could be both inside or outside a mc-chunk. But header and footer should ignore this and not push/pop or warn about nested mc. It is therefore important there to set and reset the boolean manually. See the tagpddocu-patches.sty for an example.

```
\prg_new_conditional:Nnn \__tag_mc_if_in: {p,T,F,TF}
  {
    \bool_if:NTF \g__tag_in_mc_bool
      { \prg_return_true:  }
      { \prg_return_false: }
  }

\prg_new_eq_conditional:NNn \tag_mc_if_in: \__tag_mc_if_in: {p,T,F,TF}
```

(*End definition for* `\__tag_mc_if_in:TF` *and* `\tag_mc_if_in:TF`. *This function is documented on page* 55.)

__tag_mc_bmc:n
__tag_mc_emc:
__tag_mc_bdc:nn
__tag_mc_bdc:nx

These are the low-level commands. There are now equal to the pdfmanagement commands generic mode, but we use an indirection in case luamode need something else. change 04.08.2018: the commands do not check the validity of the arguments or try to escape them, this should be done before using them.

```
% #1 tag, #2 properties
\cs_set_eq:NN \__tag_mc_bmc:n  \pdf_bmc:n
\cs_set_eq:NN \__tag_mc_emc:   \pdf_emc:
\cs_set_eq:NN \__tag_mc_bdc:nn \pdf_bdc:nn
\cs_generate_variant:Nn \__tag_mc_bdc:nn {nx}
```

(*End definition for* `\__tag_mc_bmc:n`, `\__tag_mc_emc:`, *and* `\__tag_mc_bdc:nn`.)

__tag_mc_bdc_mcid:nn
__tag_mc_bdc_mcid:n
__tag_mc_handle_mcid:nn
__tag_mc_handle_mcid:VV

This create a BDC mark with an `/MCID` key. Most of the work here is to get the current number value for the MCID: they must be numbered by page starting with 0 and then successively. The first argument is the tag, e.g. `P` or `Span`, the second is used to pass more properties. We also define a wrapper around the low-level command as luamode will need something different.

```
\cs_new_protected:Npn \__tag_mc_bdc_mcid:nn #1 #2
  {
    \int_gincr:N \c@g__tag_MCID_abs_int
    \tl_set:Nx \l__tag_mc_ref_abspage_tl
      {
        \__tag_ref_value:enn %3 args
          {
            mcid-\int_use:N \c@g__tag_MCID_abs_int
          }
          { tagabspage }
          {-1}
      }
    \prop_get:NoNTF
      \g__tag_MCID_byabspage_prop
      {
        \l__tag_mc_ref_abspage_tl
```

```
      }
      \l__tag_mc_tmpa_tl
      {
        %key already present, use value for MCID and add 1 for the next
        \int_gset:Nn \g__tag_MCID_tmp_bypage_int { \l__tag_mc_tmpa_tl }
        \__tag_prop_gput:Nxx
          \g__tag_MCID_byabspage_prop
          { \l__tag_mc_ref_abspage_tl }
          { \int_eval:n {\l__tag_mc_tmpa_tl +1} }
      }
      {
        %key not present, set MCID to 0 and insert 1
        \int_gzero:N \g__tag_MCID_tmp_bypage_int
        \__tag_prop_gput:Nxx
          \g__tag_MCID_byabspage_prop
          { \l__tag_mc_ref_abspage_tl }
          {1}
      }
    \__tag_ref_label:en
      {
        mcid-\int_use:N \c@g__tag_MCID_abs_int
      }
      { mc }
     \__tag_mc_bdc:nx
       {#1}
       { /MCID~\int_eval:n { \g__tag_MCID_tmp_bypage_int }~ \exp_not:n { #2 } }
 }
\cs_new_protected:Npn \__tag_mc_bdc_mcid:n #1
  {
    \__tag_mc_bdc_mcid:nn {#1} {}
  }

\cs_new_protected:Npn \__tag_mc_handle_mcid:nn #1 #2 %#1 tag, #2 properties
  {
    \__tag_mc_bdc_mcid:nn {#1} {#2}
  }

\cs_generate_variant:Nn \__tag_mc_handle_mcid:nn {VV}
```

(*End definition for* `\__tag_mc_bdc_mcid:nn`, `\__tag_mc_bdc_mcid:n`, *and* `\__tag_mc_handle_mcid:nn`.)

`\__tag_mc_handle_stash:n`
`\__tag_mc_handle_stash:x`

This is the handler which puts a mc into the the current structure. The argument is the number of the mc. Beside storing the mc into the structure, it also has to record the structure for the parent tree. The name is a bit confusing, it does *not* handle mc with the stash key .... TODO: why does luamode use it for begin + use, but generic mode only for begin?

```
\cs_new_protected:Npn \__tag_mc_handle_stash:n #1 %1 mcidnum
  {
    \__tag_check_mc_used:n {#1}
    \__tag_struct_kid_mc_gput_right:nn
      { \g__tag_struct_stack_current_tl }
      {#1}
   \prop_gput:Nxx \g__tag_mc_parenttree_prop
     {#1}
```

```
      { \g__tag_struct_stack_current_tl }
  }
\cs_generate_variant:Nn \__tag_mc_handle_stash:n { x }
```

(*End definition for* `\__tag_mc_handle_stash:n`.)

`\__tag_mc_bmc_artifact:`
`\__tag_mc_bmc_artifact:n`
`\__tag_mc_handle_artifact:N`

Two commands to create artifacts, one without type, and one with. We define also a wrapper handler as luamode will need a different definition. TODO: perhaps later: more properties for artifacts

```
\cs_new_protected:Npn  \__tag_mc_bmc_artifact:
  {
    \__tag_mc_bmc:n {Artifact}
  }
\cs_new_protected:Npn \__tag_mc_bmc_artifact:n #1
  {
    \__tag_mc_bdc:nn {Artifact}{/Type/#1}
  }
\cs_new_protected:Npn \__tag_mc_handle_artifact:N #1
   % #1 is a var containing the artifact type
  {
    \int_gincr:N \c@g__tag_MCID_abs_int
    \tl_if_empty:NTF #1
      { \__tag_mc_bmc_artifact: }
      { \exp_args:NV\__tag_mc_bmc_artifact:n #1 }
  }
```

(*End definition for* `\__tag_mc_bmc_artifact:`, `\__tag_mc_bmc_artifact:n`, *and* `\__tag_mc_handle_artifact:N`.)

`\__tag_get_data_mc_tag:`

This allows to retrieve the active mc-tag. It is use by the get command.

```
\cs_new:Nn \__tag_get_data_mc_tag: { \g__tag_mc_key_tag_tl }
⟨/generic⟩
```

(*End definition for* `\__tag_get_data_mc_tag:`.)

`\tag_mc_begin:n`
`\tag_mc_end:`

These are the core public commands to open and close an mc. They don't need to be in the same group or grouping level, but the code expect that they are issued linearly. The tag and the state is passed to the end command through a global var and a global boolean.

```
⟨base⟩\cs_new_protected:Npn \tag_mc_begin:n #1 { \__tag_whatsits: }
⟨base⟩\cs_new_protected:Nn \tag_mc_end:{ \__tag_whatsits: }

(*End definition for* `tag (mc-key)` *and others. These functions are documented on page* 56.)

# Part VI
# The tagpdf-mc-luacode module Code related to Marked Content (mc-chunks), luamode-specific Part of the tagpdf package

The code is splitted into three parts: code shared by all engines, code specific to luamode and code not used by luamode.

## 1 Marked content code – luamode code

luamode uses attributes to mark mc-chunks. The two attributes used are defined in the backend file. The backend also load the lua file, as it can contain functions needed elsewhere. The attributes for mc are global (between 0.6 and 0.81 they were local but this was reverted). The attributes are setup only in lua, and one should use the lua functions to set and get them.
`g_@@_mc_type_attr`: the value represent the type
`g_@@_mc_cnt_attr`: will hold the `\c@g_@@_MCID_abs_int value`

Handling attribute needs a different system to number the page wise mcid's: a `\tagmcbegin ... \tagmcend` pair no longer surrounds exactly one mc chunk: it can be split at page breaks. We know the included mcid(s) only after the ship out. So for the `struct -> mcid` mapping we need to record `struct -> mc-cnt` (in `\g_@@_mc_parenttree_prop` and/or a lua table and at shipout `mc-cnt-> {mcid, mcid, ...}` and when building the trees connect both.

Key definitions are overwritten for luatex to store that data in lua-tables. The data for the mc are in `ltx.@@.mc[absnum]`. The fields of the table are:
tag : the type (a string)
raw : more properties (string)
label: a string.
artifact: the presence indicates an artifact, the value (string) is the type.
kids: a array of tables
`{1={kid=num2,page=pagenum1}, 2={kid=num2,page=pagenum2},...}`,
this describes the chunks the mc has been split to by the traversing code
parent: the number of the structure it is in. Needed to build the parent tree.

```
⟨@@=tag⟩
⟨*luamode⟩
\ProvidesExplPackage {tagpdf-mc-code-lua} {2022-08-24} {0.97}
  {tagpdf - mc code only for the luamode }
⟨/luamode⟩
```

The main function which wanders through the shipout box to inject the literals. if the new callback is there, it is used.

```
⟨*luamode⟩
\hook_gput_code:nnn{begindocument}{tagpdf/mc}
  {
```

```
  \bool_if:NT\g__tag_active_space_bool
    {
      \lua_now:e
        {
         if~luatexbase.callbacktypes.pre_shipout_filter~then~
            luatexbase.add_to_callback("pre_shipout_filter", function(TAGBOX)~
            ltx.__tag.func.space_chars_shipout(TAGBOX)~return~true~
            end, "tagpdf")~
          end
        }
     \lua_now:e
       {
         if~luatexbase.callbacktypes.pre_shipout_filter~then~
         token.get_next()~
         end
        }\@secondoftwo\@gobble

             {
               \lua_now:e
                 { ltx.__tag.func.mark_shipout (tex.box["ShipoutBox"]) }
             }
         }
    }
}
```

## 1.1 Commands

__tag_add_missing_mcs_to_stream:Nn

This command is used in the output routine by the ptagging code. It should do nothing in luamode.

```
\cs_new_protected:Npn \__tag_add_missing_mcs_to_stream:Nn #1#2 {}
```

(*End definition for* `\__tag_add_missing_mcs_to_stream:Nn`.)

`\__tag_mc_if_in_p:`
`\__tag_mc_if_in:TF`
`\tag_mc_if_in_p:`
`\tag_mc_if_in:TF`

This tests, if we are in an mc, for attributes this means to check against a number.

```
\prg_new_conditional:Nnn \__tag_mc_if_in: {p,T,F,TF}
  {
    \int_compare:nNnTF
      { -2147483647 }
      =
      {\lua_now:e
         {
           tex.print(tex.getattribute(luatexbase.attributes.g__tag_mc_type_attr))
         }
      }
      { \prg_return_false:  }
      { \prg_return_true: }
  }

\prg_new_eq_conditional:NNn \tag_mc_if_in: \__tag_mc_if_in: {p,T,F,TF}
```

(*End definition for* `\__tag_mc_if_in:TF` *and* `\tag_mc_if_in:TF`. *This function is documented on page* 55.)

`\__tag_mc_lua_set_mc_type_attr:n`
`\__tag_mc_lua_set_mc_type_attr:o`
`\__tag_mc_lua_unset_mc_type_attr:`

This takes a tag name, and sets the attributes globally to the related number.

```
\cs_new:Nn \__tag_mc_lua_set_mc_type_attr:n % #1 is a tag name
  {
    %TODO ltx.__tag.func.get_num_from("#1") seems not to return a suitable number??
    \tl_set:Nx\l__tag_tmpa_tl{\lua_now:e{ltx.__tag.func.output_num_from ("#1")} }
    \lua_now:e
      {
        tex.setattribute
         (
          "global",
          luatexbase.attributes.g__tag_mc_type_attr,
          \l__tag_tmpa_tl
         )
      }
    \lua_now:e
      {
        tex.setattribute
         (
           "global",
           luatexbase.attributes.g__tag_mc_cnt_attr,
           \__tag_get_mc_abs_cnt:
         )
      }
  }

\cs_generate_variant:Nn\__tag_mc_lua_set_mc_type_attr:n { o }

\cs_new:Nn \__tag_mc_lua_unset_mc_type_attr:
  {
    \lua_now:e
      {
```

```
        tex.setattribute
          (
            "global",
            luatexbase.attributes.g__tag_mc_type_attr,
            -2147483647
          )
      }
     \lua_now:e
      {
        tex.setattribute
          (
            "global",
            luatexbase.attributes.g__tag_mc_cnt_attr,
            -2147483647
          )
      }
  }

```

(*End definition for* `\__tag_mc_lua_set_mc_type_attr:n` *and* `\__tag_mc_lua_unset_mc_type_attr:`.)

`\__tag_mc_insert_mcid_kids:n`
`\__tag_mc_insert_mcid_single_kids:n`

These commands will in the finish code replace the dummy for a mc by the real mcid kids we need a variant for the case that it is the only kid, to get the array right

```
\cs_new:Nn \__tag_mc_insert_mcid_kids:n
  {
    \lua_now:e { ltx.__tag.func.mc_insert_kids (#1,0) }
  }

\cs_new:Nn \__tag_mc_insert_mcid_single_kids:n
  {
    \lua_now:e {ltx.__tag.func.mc_insert_kids (#1,1) }
  }
```

(*End definition for* `\__tag_mc_insert_mcid_kids:n` *and* `\__tag_mc_insert_mcid_single_kids:n`.)

`\__tag_mc_handle_stash:n`
`\__tag_mc_handle_stash:x`

This is the lua variant for the command to put an mcid absolute number in the current structure.

```
\cs_new:Nn \__tag_mc_handle_stash:n %1 mcidnum
  {
    \__tag_check_mc_used:n { #1 }
    \seq_gput_right:cn % Don't fill a lua table due to the command in the item,
                       % so use the kernel command
      { g__tag_struct_kids_\g__tag_struct_stack_current_tl _seq }
      {
        \__tag_mc_insert_mcid_kids:n {#1}%
      }
    \lua_now:e
      {
        ltx.__tag.func.store_struct_mcabs
          (
            \g__tag_struct_stack_current_tl,#1
          )
      }
    \prop_gput:Nxx
```

```
      \g__tag_mc_parenttree_prop
      { #1 }
      { \g__tag_struct_stack_current_tl }
  }

\cs_generate_variant:Nn \__tag_mc_handle_stash:n { x }
```

(*End definition for* `\__tag_mc_handle_stash:n`.)

`\tag_mc_begin:n` This is the lua version of the user command. We currently don't check if there is nesting as it doesn't matter so much in lua.

```
\cs_set_protected:Nn \tag_mc_begin:n
  {
    \__tag_check_if_active_mc:T
      {
        \group_begin:
        %\__tag_check_mc_if_nested:
        \bool_gset_true:N \g__tag_in_mc_bool
        \bool_set_false:N\l__tag_mc_artifact_bool
        \tl_clear:N \l__tag_mc_key_properties_tl
        \int_gincr:N \c@g__tag_MCID_abs_int
```

set the default tag to the structure:

```
        \tl_set_eq:NN \l__tag_mc_key_tag_tl \g__tag_struct_tag_tl
        \tl_gset_eq:NN\g__tag_mc_key_tag_tl \g__tag_struct_tag_tl
        \lua_now:e
          {
            ltx.__tag.func.store_mc_data(\__tag_get_mc_abs_cnt:,"tag","\g__tag_struct_tag_tl")
          }
        \keys_set:nn { __tag / mc }{ label={}, #1 }
        %check that a tag or artifact has been used
        \__tag_check_mc_tag:N \l__tag_mc_key_tag_tl
        %set the attributes:
        \__tag_mc_lua_set_mc_type_attr:o  { \l__tag_mc_key_tag_tl }
        \bool_if:NF \l__tag_mc_artifact_bool
          { % store the absolute num name in a label:
            \tl_if_empty:NF {\l__tag_mc_key_label_tl}
              {
                \exp_args:NV
                 \__tag_mc_handle_mc_label:n  \l__tag_mc_key_label_tl
              }
           % if not stashed record the absolute number
            \bool_if:NF \l__tag_mc_key_stash_bool
              {
                \exp_args:NV\__tag_struct_get_tag_info:nNN
                    \g__tag_struct_stack_current_tl
                    \l__tag_tmpa_tl

```

(*End definition for* `tag (mc-key)` *and others. These functions are documented on page* 56.)

# Part VII
# The tagpdf-struct module Commands to create the structure Part of the tagpdf package

## 1 Public Commands

`\tag_struct_begin:n` `\tag_struct_begin:n{`⟨*key-values*⟩`}`
`\tag_struct_end:` `\tag_struct_end:`

These commands start and end a new structure. They don't start a group. They set all their values globally.

`\tag_struct_use:n` `\tag_struct_use:n{`⟨*label*⟩`}`

These commands insert a structure previously stashed away as kid into the currently active structure. A structure should be used only once, if the structure already has a parent a warning is issued.

`\tag_struct_object_ref:n` `\tag_struct_object_ref:n{`⟨*struct number*⟩`}`
`\tag_struct_object_ref:e`

This is a small wrapper around `\pdf_object_ref:n` to retrieve the object reference of the structure with the number ⟨*struct number*⟩. This number can be retrieved and stored for the current structure for example with `\tag_get:n{`⟨*struct*$_n$*um*⟩`}`. Be aware that it can only be used if the structure has already been created and that it doesn't check if the object actually exists!

The following two functions are used to add annotations. They must be used together and with care to get the same numbers. Perhaps some improvements are needed here.

`\tag_struct_insert_annot:nn` `\tag_struct_insert_annot:nn{`⟨*object reference*⟩`}{`⟨*struct parent number*⟩`}`

This inserts an annotation in the structure. ⟨*object reference*⟩ is there reference to the annotation. ⟨*struct parent number*⟩ should be the same number as had been inserted with `\tag_struct_parent_int:` as `StructParent` value to the dictionary of the annotion. The command will increase the value of the counter used by `\tag_struct_parent_int:`.

`\tag_struct_parent_int:` `\tag_struct_parent_int:`

This gives back the next free /StructParent number (assuming that it is together with `\tag_struct_insert_annot:nn` which will increase the number.

# 2 Public keys

## 2.1 Keys for the structure commands

`tag␣(struct-key)` This is required. The value of the key is normally one of the standard types listed in the main tagpdf documentation. It is possible to setup new tags/types. The value can also be of the form `type/NS`, where `NS` is the shorthand of a declared name space. Currently the names spaces `pdf`, `pdf2`, `mathml` and `user` are defined. This allows to use a different name space than the one connected by default to the tag. But normally this should not be needed.

`stash␣(struct-key)` Normally a new structure inserts itself as a kid into the currently active structure. This key prohibits this. The structure is nevertheless from now on "the current active structure" and parent for following marked content and structures.

`label␣(struct-key)` This key sets a label by which one can refer to the structure. It is e.g. used by `\tag_struct_use:n` (where a real label is actually not needed as you can only use structures already defined), and by the `ref` key (which can refer to future structures). Internally the label name will start with `tagpdfstruct-` and it stores the two attributs `tagstruct` (the structure number) and `tagstructobj` (the object reference).

`parent␣(struct-key)` By default a structure is added as kid to the currently active structure. With the parent key one can choose another parent. The value is a structure number which must refer to an already existing, previously created structure. Such a structure number can for example be have been stored with `\tag_get:n`, but one can also use a label on the parent structure and then use `\ref_value:nn{tagpdfstruct-label}{tagstruct}` to retrieve it.

`title␣(struct-key)`
`title-o␣(struct-key)` This keys allows to set the dictionary entry `/Title` in the structure object. The value is handled as verbatim string and hex encoded. Commands are not expanded. `title-o` will expand the value once.

`alt␣(struct-key)` This key inserts an `/Alt` value in the dictionary of structure object. The value is handled as verbatim string and hex encoded. The value will be expanded first once.

`actualtext␣(struct-key)` This key inserts an `/ActualText` value in the dictionary of structure object. The value is handled as verbatim string and hex encoded. The value will be expanded first once.

`lang␣(struct-key)` This key allows to set the language for a structure element. The value should be a bcp-identifier, e.g. `de-De`.

`ref␣(struct-key)` This key allows to add references to other structure elements, it adds the `/Ref` array to the structure. The value should be a comma separated list of structure labels set with the `label` key. e.g. `ref={label1,label2}`.

`E␣(struct-key)` This key sets the `/E` key, the expanded form of an abbreviation or an acronym (I couldn't think of a better name, so I sticked to E).

`AF␣(struct-key)` `AF =` ⟨*object name*⟩
`AFinline␣(struct-key)` `AF-inline =` ⟨*text content*⟩
`AFinline-o␣(struct-key)`

These keys allows to reference an associated file in the structure element. The value ⟨*object name*⟩ should be the name of an object pointing to the `/Filespec` dictionary as expected by `\pdf_object_ref:n` from a current `l3kernel`.

The value `AF-inline` is some text, which is embedded in the PDF as a text file with mime type text/plain. `AF-inline-o` is like `AF-inline` but expands the value once.

Future versions will perhaps extend this to more mime types, but it is still a research task to find out what is really needed.

`AF` can be used more than once, to associate more than one file. The inline keys can be used only once per structure. Additional calls are ignored.

`attribute␣(struct-key)` This key takes as argument a comma list of attribute names (use braces to protect the commas from the external key-val parser) and allows to add one or more attribute dictionary entries in the structure object. As an example

```
\tagstructbegin{tag=TH,attribute= TH-row}
```

Attribute names and their content must be declared first in `\tagpdfsetup`.

`attribute-class␣(struct-key)`

This key takes as argument a comma list of attribute class names (use braces to protect the commas from the external key-val parser) and allows to add one or more attribute classes to the structure object.

Attribute class names and their content must be declared first in `\tagpdfsetup`.

### 2.2 Setup keys

newattribute␣(setup-key) `newattribute = {⟨name⟩}{⟨Content⟩}`

This key can be used in the setup command `\tagpdfsetup` and allow to declare a new attribute, which can be used as attribute or attribute class. The value are two brace groups, the first contains the name, the second the content.

```
\tagpdfsetup
 {
  newattribute =
   {TH-col}{/O /Table /Scope /Column},
  newattribute =
   {TH-row}{/O /Table /Scope /Row},
  }
```

root-AF␣(setup-key) `root-AF = ⟨object name⟩`

This key can be used in the setup command `\tagpdfsetup` and allows to add associated files to the root structure. Like `AF` it can be used more than once to add more than one file.

```
⟨@@=tag⟩
⟨*header⟩
\ProvidesExplPackage {tagpdf-struct-code} {2022-08-24} {0.97}
 {part of tagpdf - code related to storing structure}
⟨/header⟩
```

# 3 Variables

\c@g__tag_struct_abs_int Every structure will have a unique, absolute number. I will use a latex counter for the structure count to have a chance to avoid double structures in align etc.

```
⟨base⟩\newcounter  { g__tag_struct_abs_int }
⟨base⟩\int_gzero:N \c@g__tag_struct_abs_int
```

(*End definition for* `\c@g__tag_struct_abs_int`.)

\g__tag_struct_objR_seq a sequence to store mapping between the structure number and the object number. We assume that structure numbers are assign consecutively and so the index of the seq can be used. A seq allows easy mapping over the structures.

```
⟨*package⟩
\__tag_seq_new:N  \g__tag_struct_objR_seq
```

(*End definition for* `\g__tag_struct_objR_seq`.)

\g__tag_struct_cont_mc_prop in generic mode it can happen after a page break that we have to inject into a structure sequence an additional mc after. We will store this additional info in a property. The key is the absolut mc num, the value the pdf directory.

```
\__tag_prop_new:N  \g__tag_struct_cont_mc_prop
```

(*End definition for* `\g__tag_struct_cont_mc_prop`.)

\g__tag_struct_stack_seq A stack sequence for the structure stack. When a sequence is opened it's number is put on the stack.

```
\seq_new:N    \g__tag_struct_stack_seq
\seq_gpush:Nn \g__tag_struct_stack_seq {0}
```

(*End definition for* `\g__tag_struct_stack_seq`.)

\g__tag_struct_tag_stack_seq We will perhaps also need the tags. While it is possible to get them from the numbered stack, lets build a tag stack too.

```
\seq_new:N    \g__tag_struct_tag_stack_seq
\seq_gpush:Nn \g__tag_struct_tag_stack_seq {Root}
```

(*End definition for* `\g__tag_struct_tag_stack_seq`.)

\g__tag_struct_tag_NS_prop For the parent-child check, we need the tag and NS of every structure

```
\prop_new:N\g__tag_struct_tag_NS_prop
```

(*End definition for* `\g__tag_struct_tag_NS_prop`.)

\g__tag_struct_stack_current_tl
\l__tag_struct_stack_parent_tmpa_tl The global variable will hold the current structure number. It is already defined in `tagpdf-base`. The local temporary variable will hold the parent when we fetch it from the stack.

```
⟨/package⟩
⟨base⟩\tl_new:N  \g__tag_struct_stack_current_tl
⟨base⟩\tl_gset:Nn \g__tag_struct_stack_current_tl {\int_use:N\c@g__tag_struct_abs_int}
⟨*package⟩
\tl_new:N     \l__tag_struct_stack_parent_tmpa_tl
```

(*End definition for* `\g__tag_struct_stack_current_tl` *and* `\l__tag_struct_stack_parent_tmpa_tl`.)

I will need at least one structure: the StructTreeRoot normally it should have only one kid, e.g. the document element.

The data of the StructTreeRoot and the StructElem are in properties: `\g_@@_struct_0_prop` for the root and `\g_@@_struct_N_prop`, $N \geq = 1$ for the other.

This creates quite a number of properties, so perhaps we will have to do this more efficiently in the future.

All properties have at least the keys

**Type** StructTreeRoot or StructElem

and the keys from the two following lists (the root has a special set of properties). the values of the prop should be already escaped properly when the entries are created (title,lange,alt,E,actualtext)

\c__tag_struct_StructTreeRoot_entries_seq
\c__tag_struct_StructElem_entries_seq These seq contain the keys we support in the two object types. They are currently no longer used, but are provided as documentation and for potential future checks. They should be adapted if there are changes in the PDF format.

```
\seq_const_from_clist:Nn \c__tag_struct_StructTreeRoot_entries_seq
  {%p. 857/858
    Type,              % always /StructTreeRoot
    K,                 % kid, dictionary or array of dictionaries
    IDTree,            % currently unused
    ParentTree,        % required,obj ref to the parent tree
    ParentTreeNextKey, % optional
    RoleMap,
```

```
    ClassMap,
    Namespaces,
    AF                  %pdf 2.0
  }

\seq_const_from_clist:Nn \c__tag_struct_StructElem_entries_seq
  {%p 858 f
    Type,               %always /StructElem
    S,                  %tag/type
    P,                  %parent
    ID,                 %optional
    Ref,                %optional, pdf 2.0 Use?
    Pg,                 %obj num of starting page, optional
    K,                  %kids
    A,                  %attributes, probably unused
    C,                  %class ""
    %R,                 %attribute revision number, irrelevant for us as we
                        % don't update/change existing PDF and (probably)
                        % deprecated in PDF 2.0
    T,                  %title, value in () or <>
    Lang,               %language
    Alt,                % value in () or <>
    E,                  % abreviation
    ActualText,
    AF,                  %pdf 2.0, array of dict, associated files
    NS,                  %pdf 2.0, dict, namespace
    PhoneticAlphabet,   %pdf 2.0
    Phoneme              %pdf 2.0
  }
```

(*End definition for* `\c__tag_struct_StructTreeRoot_entries_seq` *and* `\c__tag_struct_StructElem_entries_seq`.)

## 3.1 Variables used by the keys

`\g__tag_struct_tag_tl` Use by the tag key to store the tag and the namespace.

`\g__tag_struct_tag_NS_tl`

```
\tl_new:N \g__tag_struct_tag_tl
\tl_new:N \g__tag_struct_tag_NS_tl
```

(*End definition for* `\g__tag_struct_tag_tl` *and* `\g__tag_struct_tag_NS_tl`.)

`\l__tag_struct_key_label_tl` This will hold the label value.

```
\tl_new:N \l__tag_struct_key_label_tl
```

(*End definition for* `\l__tag_struct_key_label_tl`.)

`\l__tag_struct_elem_stash_bool` This will keep track of the stash status

```
\bool_new:N \l__tag_struct_elem_stash_bool
```

(*End definition for* `\l__tag_struct_elem_stash_bool`.)

### 3.2 Variables used by tagging code of basic elements

\g__tag_struct_dest_num_prop

This variable records for (some or all, not clear yet) destination names the related structure number to allow to reference them in a Ref. The key is the destination. It is currently used by the toc-tagging and sec-tagging code.

```
\prop_new:N \g__tag_struct_dest_num_prop
```

(*End definition for* `\g__tag_struct_dest_num_prop`.)

\g__tag_struct_ref_by_dest_prop

This variable contains structures whose Ref key should be updated at the end to point to structured related with this destination. As this is probably need in other places too, it is not only a toc-variable.

```
\prop_new:N \g__tag_struct_ref_by_dest_prop
```

(*End definition for* `\g__tag_struct_ref_by_dest_prop`.)

## 4 Commands

The properties must be in some places handled expandably. So I need an output handler for each prop, to get expandable output see https://tex.stackexchange.com/questions/424208. There is probably room here for a more efficient implementation. TODO check if this can now be implemented with the pdfdict commands. The property contains currently non pdf keys, but e.g. object numbers are perhaps no longer needed as we have named object anyway.

__tag_struct_output_prop_aux:nn
__tag_new_output_prop_handler:n

```
\cs_new:Npn \__tag_struct_output_prop_aux:nn #1 #2 %#1 num, #2 key
  {
    \prop_if_in:cnT
      { g__tag_struct_#1_prop }
      { #2 }
      {
        \c_space_tl/#2~ \prop_item:cn{ g__tag_struct_#1_prop } { #2 }
      }
  }

\cs_new_protected:Npn \__tag_new_output_prop_handler:n #1
  {
    \cs_new:cn { __tag_struct_output_prop_#1:n }
      {
        \__tag_struct_output_prop_aux:nn {#1}{##1}
      }
  }
```

(*End definition for* `\__tag_struct_output_prop_aux:nn` *and* `\__tag_new_output_prop_handler:n`.)

## 4.1 Initialization of the StructTreeRoot

The first structure element, the StructTreeRoot is special, so created manually. The underlying object is `@@/struct/0` which is currently created in the tree code (TODO move it here). The `ParentTree` and `RoleMap` entries are added at begin document in the tree code as they refer to object which are setup in other parts of the code. This avoid timing issues.

```
\tl_gset:Nn \g__tag_struct_stack_current_tl {0}
```

__tag_pdf_name_e:n

```
\cs_new:Npn \__tag_pdf_name_e:n #1{\pdf_name_from_unicode_e:n{#1}}
```

(*End definition for* `\__tag_pdf_name_e:n`.)

g__tag_struct_0_prop
g__tag_struct_kids_0_seq

```
\__tag_prop_new:c { g__tag_struct_0_prop }
\__tag_new_output_prop_handler:n {0}
\__tag_seq_new:c  { g__tag_struct_kids_0_seq }

\__tag_prop_gput:cnx
  { g__tag_struct_0_prop }
  { Type }
  { \pdf_name_from_unicode_e:n {StructTreeRoot} }

\__tag_prop_gput:cnx
  { g__tag_struct_0_prop }
  { S }
  { \pdf_name_from_unicode_e:n {StructTreeRoot} }

\prop_gput:Nnn \g__tag_struct_tag_NS_prop {0}{{StructTreeRoot}{pdf}}
```

Namespaces are pdf 2.0 but it doesn't harm to have an empty entry. We could add a test, but if the code moves into the kernel, timing could get tricky.

```
\__tag_prop_gput:cnx
  { g__tag_struct_0_prop }
  { Namespaces }
  { \pdf_object_ref:n { __tag/tree/namespaces } }
```

(*End definition for* `g__tag_struct_0_prop` *and* `g__tag_struct_kids_0_seq`.)

## 4.2 Filling in the tag info

__tag_struct_set_tag_info:nnn

This adds or updates the tag info to a structure given by a number. We need also the original data, so we store both.

```
\pdf_version_compare:NnTF < {2.0}
 {
   \cs_new_protected:Npn \__tag_struct_set_tag_info:nnn #1 #2 #3
     %#1 structure number, #2 tag, #3 NS
     {
       \__tag_prop_gput:cnx
         { g__tag_struct_#1_prop }
         { S }
         { \pdf_name_from_unicode_e:n {#2}  } %
       \prop_gput:Nnn \g__tag_struct_tag_NS_prop {#1}{{#2}{#3}}
```

```
    }
}
{
  \cs_new_protected:Npn \__tag_struct_set_tag_info:nnn #1 #2 #3
    {
      \__tag_prop_gput:cnx
        { g__tag_struct_#1_prop }
        { S }
        { \pdf_name_from_unicode_e:n {#2} } %
      \prop_get:NnNT \g__tag_role_NS_prop {#3} \l__tag_get_tmpc_tl
        {
          \__tag_prop_gput:cnx
            { g__tag_struct_#1_prop }
            { NS }
            { \l__tag_get_tmpc_tl } %
        }
      \prop_gput:Nnn \g__tag_struct_tag_NS_prop {#1}{{#2}{#3}}
    }
}
\cs_generate_variant:Nn \__tag_struct_set_tag_info:nnn {eVV}
```

(*End definition for* `\__tag_struct_set_tag_info:nnn`.)

`\cc` We also need a way to get the tag info back from parent structures.

```
\cs_new_protected:Npn \__tag_struct_get_tag_info:nNN #1 #2 #3
  %#1 struct num, #2 tlvar for tag , #3 tlvar for NS
   {
      \prop_get:NnNTF \g__tag_struct_tag_NS_prop {#1}\l__tag_get_tmpc_tl
        {
          \tl_set:Nx #2{\exp_last_unbraced:NV\use_i:nn  \l__tag_get_tmpc_tl}
          \tl_set:Nx #3{\exp_last_unbraced:NV\use_ii:nn \l__tag_get_tmpc_tl}
        }
        {
          \tl_clear:N#2
          \tl_clear:N#3
        }
   }
\cs_generate_variant:Nn\__tag_struct_get_tag_info:nNN {eNN}
```

(*End definition for* `\cc`. *This function is documented on page* **??**.)

## 4.3 Handlings kids

Commands to store the kids. Kids in a structure can be a reference to a mc-chunk, an object reference to another structure element, or a object reference to an annotation (through an OBJR object).

`\__tag_struct_kid_mc_gput_right:nn` `\__tag_struct_kid_mc_gput_right:nx` The command to store an mc-chunk, this is a dictionary of type MCR. It would be possible to write out the content directly as unnamed object and to store only the object reference, but probably this would be slower, and the PDF is more readable like this. The code doesn't try to avoid the use of the /Pg key by checking page numbers. That imho only slows down without much gain. In generic mode the page break code will perhaps to have to insert an additional mcid after an existing one. For this we use a property list At first an auxiliary to write the MCID dict. This should normally be expanded!

```
\cs_new:Npn \__tag_struct_mcid_dict:n #1 %#1 MCID absnum
  {
     <<
      /Type \c_space_tl /MCR \c_space_tl
      /Pg
        \c_space_tl
      \pdf_pageobject_ref:n { \__tag_ref_value:enn{mcid-#1}{tagabspage}{1} }
       /MCID \c_space_tl \__tag_ref_value:enn{mcid-#1}{tagmcid}{1}
     >>
  }
\cs_new_protected:Npn \__tag_struct_kid_mc_gput_right:nn #1 #2 %#1 structure num, #2 MCID absn
  {
    \__tag_seq_gput_right:cx
      { g__tag_struct_kids_#1_seq }
      {
        \__tag_struct_mcid_dict:n {#2}
      }
    \__tag_seq_gput_right:cn
      { g__tag_struct_kids_#1_seq }
      {
        \prop_item:Nn \g__tag_struct_cont_mc_prop {#2}
      }
  }
\cs_generate_variant:Nn \__tag_struct_kid_mc_gput_right:nn {nx}

```

(*End definition for* `\__tag_struct_kid_mc_gput_right:nn`.)

`\__tag_struct_kid_struct_gput_right:nn` `\__tag_struct_kid_struct_gput_right:xx`

This commands adds a structure as kid. We only need to record the object reference in the sequence.

```
\cs_new_protected:Npn\__tag_struct_kid_struct_gput_right:nn #1 #2 %#1 num of parent struct, #2
  {
    \__tag_seq_gput_right:cx
      { g__tag_struct_kids_#1_seq }
      {
        \pdf_object_ref:n { __tag/struct/#2 }
      }
 }

\cs_generate_variant:Nn \__tag_struct_kid_struct_gput_right:nn {xx}
```

(*End definition for* `\__tag_struct_kid_struct_gput_right:nn`.)

`\__tag_struct_kid_OBJR_gput_right:nnn` `\__tag_struct_kid_OBJR_gput_right:xxx`

At last the command to add an OBJR object. This has to write an object first. The first argument is the number of the parent structure, the second the (expanded) object reference of the annotation. The last argument is the page object reference

```
\cs_new_protected:Npn\__tag_struct_kid_OBJR_gput_right:nnn #1 #2 #3 %#1 num of parent struct,
                                                          %#2 obj reference
                                                          %#3 page object reference
  {
    \pdf_object_unnamed_write:nn
      { dict }
      {
        /Type/OBJR/Obj~#2/Pg~#3
```

```
      }
    \__tag_seq_gput_right:cx
      { g__tag_struct_kids_#1_seq }
      {
        \pdf_object_ref_last:
      }
  }

\cs_generate_variant:Nn\__tag_struct_kid_OBJR_gput_right:nnn { xxx }

```

(*End definition for* `\__tag_struct_kid_OBJR_gput_right:nnn`.)

`\__tag_struct_exchange_kid_command:N`
`\__tag_struct_exchange_kid_command:c`

In luamode it can happen that a single kid in a structure is split at a page break into two or more mcid. In this case the lua code has to convert put the dictionary of the kid into an array. See issue 13 at tagpdf repo. We exchange the dummy command for the kids to mark this case.

```
\cs_new_protected:Npn\__tag_struct_exchange_kid_command:N #1 %#1 = seq var
  {
    \seq_gpop_left:NN #1 \l__tag_tmpa_tl
    \regex_replace_once:nnN
      { \c{\__tag_mc_insert_mcid_kids:n} }
      { \c{\__tag_mc_insert_mcid_single_kids:n} }
      \l__tag_tmpa_tl
    \seq_gput_left:NV #1 \l__tag_tmpa_tl
  }

\cs_generate_variant:Nn\__tag_struct_exchange_kid_command:N { c }
```

(*End definition for* `\__tag_struct_exchange_kid_command:N`.)

`\__tag_struct_fill_kid_key:n`

This command adds the kid info to the K entry. In lua mode the content contains commands which are expanded later. The argument is the structure number.

```
\cs_new_protected:Npn \__tag_struct_fill_kid_key:n #1 %#1 is the struct num
  {
    \bool_if:NF\g__tag_mode_lua_bool
     {
        \seq_clear:N \l__tag_tmpa_seq
        \seq_map_inline:cn { g__tag_struct_kids_#1_seq }
         { \seq_put_right:Nx \l__tag_tmpa_seq { ##1 } }
        %\seq_show:c { g__tag_struct_kids_#1_seq }
        %\seq_show:N \l__tag_tmpa_seq
        \seq_remove_all:Nn \l__tag_tmpa_seq {}
        %\seq_show:N \l__tag_tmpa_seq
        \seq_gset_eq:cN { g__tag_struct_kids_#1_seq } \l__tag_tmpa_seq
     }

    \int_case:nnF
      {
        \seq_count:c
          {
            g__tag_struct_kids_#1_seq
          }
      }
```

```
      {
        { 0 }
         { } %no kids, do nothing
        { 1 } % 1 kid, insert
         {
           % in this case we need a special command in
           % luamode to get the array right. See issue #13
           \bool_if:NT\g__tag_mode_lua_bool
             {
               \__tag_struct_exchange_kid_command:c
                {g__tag_struct_kids_#1_seq}
             }
           \__tag_prop_gput:cnx { g__tag_struct_#1_prop } {K}
             {
               \seq_item:cn
                 {
                   g__tag_struct_kids_#1_seq
                 }
                 {1}

         } %
      }
      { %many kids, use an array
        \__tag_prop_gput:cnx { g__tag_struct_#1_prop } {K}
          {
            [
              \seq_use:cn
                {
                  g__tag_struct_kids_#1_seq
                }
                {
                  \c_space_tl
                }
            ]
          }
      }
  }

```

(*End definition for* `\__tag_struct_fill_kid_key:n`.)

## 4.4 Output of the object

`\__tag_struct_get_dict_content:nN`

This maps the dictionary content of a structure into a tl-var. Basically it does what `\pdfdict_use:n` does. TODO!! this looks over-complicated. Check if it can be done with pdfdict now.

```
\cs_new_protected:Npn \__tag_struct_get_dict_content:nN #1 #2 %#1: stucture num
  {
    \tl_clear:N #2
    \seq_map_inline:cn
      {
        c__tag_struct_
         \int_compare:nNnTF{#1}={0}{StructTreeRoot}{StructElem}
         _entries_seq
```

```
      }
      {
        \tl_put_right:Nx
          #2
          {
              \prop_if_in:cnT
                { g__tag_struct_#1_prop }
                { ##1 }
                {
                  \c_space_tl/##1~
```

Some keys needs the option to format the key, e.g. add brackets for an array

```
                  \cs_if_exist_use:cTF {__tag_struct_format_##1:e}
                    {
                      { \prop_item:cn{ g__tag_struct_#1_prop } { ##1 } }
                    }
                    {
                      \prop_item:cn{ g__tag_struct_#1_prop } { ##1 }
                    }
                }
          }
      }
  }
```

(*End definition for* `\__tag_struct_get_dict_content:nnN`.)

`\__tag_struct_format_Ref:n` Ref is an array, we store only the content to be able to extend it so the formatting command adds the brackets:

```
\cs_new:Nn\__tag_struct_format_Ref:n{[#1]}
\cs_generate_variant:Nn\__tag_struct_format_Ref:n{e}
```

(*End definition for* `\__tag_struct_format_Ref:n`.)

`\__tag_struct_write_obj:n` This writes out the structure object. This is done in the finish code, in the tree module and guarded by the tree boolean.

```
\cs_new_protected:Npn \__tag_struct_write_obj:n #1 % #1 is the struct num
  {
    \pdf_object_if_exist:nTF { __tag/struct/#1 }
      {
        \__tag_struct_fill_kid_key:n { #1 }
        \__tag_struct_get_dict_content:nN { #1 } \l__tag_tmpa_tl
        \exp_args:Nx
          \pdf_object_write:nnx
            { __tag/struct/#1 }
            {dict}
            {
              \l__tag_tmpa_tl
            }
      }
      {
        \msg_error:nnn { tag } { struct-no-objnum } { #1}
      }
  }
```

(*End definition for* `\__tag_struct_write_obj:n`.)

__tag_struct_insert_annot:nn This is the command to insert an annotation into the structure. It can probably be used for xform too.

Annotations used as structure content must

1. add a StructParent integer to their dictionary
2. push the object reference as OBJR object in the structure
3. Add a Structparent/obj-nr reference to the parent tree.

For a link this looks like this

```
        \tag_struct_begin:n { tag=Link }
        \tag_mc_begin:n { tag=Link }
(1)     \pdfannot_dict_put:nnx
          { link/URI }
          { StructParent }
          { \int_use:N\c@g_@@_parenttree_obj_int }
   <start link> link text <stop link>
(2+3)   \@@_struct_insert_annot:nn {obj ref}{parent num}
        \tag_mc_end:
        \tag_struct_end:
```

```
\cs_new_protected:Npn \__tag_struct_insert_annot:nn #1 #2 %#1 object reference to the annotati
                                                       %#2 structparent number
  {
    \bool_if:NT \g__tag_active_struct_bool
      {
        %get the number of the parent structure:
        \seq_get:NNF
          \g__tag_struct_stack_seq
          \l__tag_struct_stack_parent_tmpa_tl
          {
            \msg_error:nn { tag } { struct-faulty-nesting }
          }
        %put the obj number of the annot in the kid entry, this also creates
        %the OBJR object
        \ref_label:nn {__tag_objr_page_#2 }{ tagabspage }
        \__tag_struct_kid_OBJR_gput_right:xxx
          {
            \l__tag_struct_stack_parent_tmpa_tl
          }
          {
            #1 %
          }
          {
            \pdf_pageobject_ref:n { \__tag_ref_value:nnn {__tag_objr_page_#2 }{ tagabspage }{1
          }
        % add the parent obj number to the parent tree:
        \exp_args:Nnx
        \__tag_parenttree_add_objr:nn
          {
            #2
          }
          {
```

```
            \pdf_object_ref:e { __tag/struct/\l__tag_struct_stack_parent_tmpa_tl }
          }
        % increase the int:
        \stepcounter{ g__tag_parenttree_obj_int }
      }
  }
```

(*End definition for* `\__tag_struct_insert_annot:nn`.)

`\__tag_get_data_struct_tag:` this command allows `\tag_get:n` to get the current structure tag with the keyword `struct_tag`. We will need to handle nesting

```
\cs_new:Npn \__tag_get_data_struct_tag:
  {
    \exp_args:Ne
    \tl_tail:n
     {
       \prop_item:cn {g__tag_struct_\g__tag_struct_stack_current_tl _prop}{S}
     }
  }
⟨/package⟩
```

(*End definition for* `\__tag_get_data_struct_tag:`.)

`\__tag_get_data_struct_num:` this command allows `\tag_get:n` to get the current structure number with the keyword `struct_num`. We will need to handle nesting

```
⟨*base⟩
\cs_new:Npn \__tag_get_data_struct_num:
  {
    \g__tag_struct_stack_current_tl
  }
⟨/base⟩
```

(*End definition for* `\__tag_get_data_struct_num:`.)

# 5 Keys

This are the keys for the user commands. we store the tag in a variable. But we should be careful, it is only reliable at the begin.

`label␣(struct-key)`
`stash␣(struct-key)`
`parent␣(struct-key)`
`tag␣(struct-key)`
`title␣(struct-key)`
`title-o␣(struct-key)`
`alt␣(struct-key)`
`actualtext␣(struct-key)`
`lang␣(struct-key)`
`ref␣(struct-key)`
`E␣(struct-key)`

```
⟨*package⟩
\keys_define:nn { __tag / struct }
  {
    label .tl_set:N      = \l__tag_struct_key_label_tl,
    stash .bool_set:N    = \l__tag_struct_elem_stash_bool,
    parent .code:n       =
      {
        \bool_lazy_and:nnTF
          {
            \prop_if_exist_p:c { g__tag_struct_\int_eval:n {#1}_prop }
          }
          {
            \int_compare_p:nNn {#1}<{\c@g__tag_struct_abs_int}
          }
```

```
        { \tl_set:Nx \l__tag_struct_stack_parent_tmpa_tl { \int_eval:n {#1} } }
        {
          \msg_warning:nnxx { tag } { struct-unknown }

          { <\l__tag_tmpa_str> }
      },
  }
```

(*End definition for* `label (struct-key)` *and others. These functions are documented on page 84.*)

`AF␣(struct-key)`
`AFinline␣(struct-key)`
`AFinline-o␣(struct-key)`

keys for the AF keys (associated files). They use commands from l3pdffile! The stream variants use txt as extension to get the mimetype. TODO: check if this should be configurable. For math we will perhaps need another extension. AF is an array and can be used more than once, so we store it in a tl. which is expanded. AFinline can be use only once (more quite probably doesn't make sense).

```
\cs_new_protected:Npn \__tag_struct_add_AF:nn #1 #2 % #1 struct num #2 object name
  {
     \tl_if_exist:cTF
       {

            }
        }
        {
          \msg_warning:nnn{ tag }{struct-label-unknown}{#1}
        }
    }
  }
⟨/package⟩
```

(*End definition for* `\tag_struct_use:n`. *This function is documented on page* 83.)

`\tag_struct_object_ref:n` This is a command that allows to reference a structure. The argument is the number which can be get for the current structure with `\tag_get:n{struct_num}` TODO check if it should be in base too.

```
⟨*package⟩
\cs_new:Npn \tag_struct_object_ref:n #1
 {
   \pdf_object_ref:n {__tag/struct/#1}
 }
\cs_generate_variant:Nn \tag_struct_object_ref:n {e}
```

(*End definition for* `\tag_struct_object_ref:n`. *This function is documented on page* 83.)

`\tag_struct_gput:nnn` This is a command that allows to update the data of a structure. The first argument is the number of the structure, the second a keyword referring to a function, the third the value. Currently the only keyword is `ref`

```
\cs_new_protected:Npn \tag_struct_gput:nnn #1 #2 #3
 {
   \cs_if_exist_use:cF {__tag_struct_gput_data_#2:nn}
    { %warning??
      \use_none:nn
    }
    {#1}{#3}
 }
\cs_generate_variant:Nn \tag_struct_gput:nnn {ene,nne}
```

(*End definition for* `\tag_struct_gput:nnn`. *This function is documented on page* ??.)

`\__tag_struct_gput_data_ref:nn`

```
\cs_new_protected:Npn \__tag_struct_gput_data_ref:nn #1 #2
   % #1 receiving struct num, #2 list of object ref
   {
     \prop_get:cnN

   }
\cs_generate_variant:Nn \__tag_struct_gput_data_ref:nn {ee}
```

(*End definition for* `\__tag_struct_gput_data_ref:nn`.)

`\tag_struct_insert_annot:nn`
`\tag_struct_insert_annot:xx`
`\tag_struct_parent_int:`

This are the user command to insert annotations. They must be used together to get the numbers right. They use a counter to the `StructParent` and `\tag_struct_insert_annot:nn` increases the counter given back by `\tag_struct_parent_int:`.

It must be used together with `\tag_struct_parent_int:` to insert an annotation. TODO: decide how it should be guarded if tagging is deactivated.

```
\cs_new_protected:Npn \tag_struct_insert_annot:nn #1 #2 %#1 should be an object reference
                                                        %#2 struct parent num
  {
    \__tag_check_if_active_struct:T
      {
        \__tag_struct_insert_annot:nn {#1}{#2}
      }
  }
```

```
\cs_generate_variant:Nn \tag_struct_insert_annot:nn {xx}
\cs_new:Npn \tag_struct_parent_int: {\int_use:c { c@g__tag_parenttree_obj_int }}

⟨/package⟩
```

(*End definition for* `\tag_struct_insert_annot:nn` *and* `\tag_struct_parent_int:`*. These functions are documented on page 83.*)

# 7 Attributes and attribute classes

```
⟨*header⟩
\ProvidesExplPackage {tagpdf-attr-code} {2022-08-24} {0.97}
  {part of tagpdf - code related to attributes and attribute classes}
⟨/header⟩
```

## 7.1 Variables

`\g__tag_attr_entries_prop`
`\g__tag_attr_class_used_seq`
`\g__tag_attr_objref_prop`
`\l__tag_attr_value_tl`

`\g_@@_attr_entries_prop` will store attribute names and their dictionary content. `\g_@@_attr_class_used_seq` will hold the attributes which have been used as class name. `\l_@@_attr_value_tl` is used to build the attribute array or key. Everytime an attribute is used for the first time, and object is created with its content, the name-object reference relation is stored in `\g_@@_attr_objref_prop`

```
⟨*package⟩
\prop_new:N \g__tag_attr_entries_prop
\seq_new:N  \g__tag_attr_class_used_seq
\tl_new:N   \l__tag_attr_value_tl
\prop_new:N \g__tag_attr_objref_prop %will contain obj num of used attributes
```

(*End definition for* `\g__tag_attr_entries_prop` *and others.*)

## 7.2 Commands and keys

`\__tag_attr_new_entry:nn`
`newattribute␣(setup-key)`

This allows to define attributes. Defined attributes are stored in a global property. `newattribute` expects two brace group, the name and the content. The content typically needs an `/O` key for the owner. An example look like this.

```
\tagpdfsetup
 {
  newattribute =
   {TH-col}{/O /Table /Scope /Column},
  newattribute =
   {TH-row}{/O /Table /Scope /Row},
  }
```

```
\cs_new_protected:Npn \__tag_attr_new_entry:nn #1 #2 %#1:name, #2: content
  {
    \prop_gput:Nen \g__tag_attr_entries_prop
      {\pdf_name_from_unicode_e:n{#1}}{#2}
  }

\keys_define:nn { __tag / setup }
  {
```

```
    newattribute .code:n =
      {
        \__tag_attr_new_entry:nn #1
      }
  }
```

(*End definition for* `\__tag_attr_new_entry:nn` *and* `newattribute (setup-key)`*. This function is documented on page 86.*)

`attribute-class␣(struct-key)` attribute-class has to store the used attribute names so that they can be added to the ClassMap later.

```
\keys_define:nn { __tag / struct }
  {
    attribute-class .code:n =
     {
       \clist_set:No \l__tag_tmpa_clist { #1 }
       \seq_set_from_clist:NN \l__tag_tmpb_seq \l__tag_tmpa_clist
```

we convert the names into pdf names with slash

```
       \seq_set_map_x:NNn \l__tag_tmpa_seq \l__tag_tmpb_seq
         {
           \pdf_name_from_unicode_e:n {##1}
         }
       \seq_map_inline:Nn \l__tag_tmpa_seq
         {
           \prop_if_in:NnF \g__tag_attr_entries_prop {##1}
             {
               \msg_error:nnn { tag } { attr-unknown } { ##1 }
             }
           \seq_gput_left:Nn\g__tag_attr_class_used_seq { ##1}
         }
       \tl_set:Nx \l__tag_tmpa_tl
         {
           \int_compare:nT { \seq_count:N \l__tag_tmpa_seq > 1 }{[}
           \seq_use:Nn \l__tag_tmpa_seq  { \c_space_tl  }
           \int_compare:nT { \seq_count:N \l__tag_tmpa_seq > 1 }{]}
         }
       \int_compare:nT { \seq_count:N \l__tag_tmpa_seq > 0 }
         {
           \__tag_prop_gput:cnx
             { g__tag_struct_\int_eval:n {\c@g__tag_struct_abs_int}_prop }
             { C }
             { \l__tag_tmpa_tl }
          %\prop_show:c  { g__tag_struct_\int_eval:n {\c@g__tag_struct_abs_int}_prop }
         }
     }
  }
```

(*End definition for* `attribute-class (struct-key)`*. This function is documented on page 85.*)

`attribute␣(struct-key)`

```
\keys_define:nn { __tag / struct }
  {
    attribute .code:n  = % A property (attribute, value currently a dictionary)
      {
```

```
        \clist_set:No          \l__tag_tmpa_clist { #1 }
        \seq_set_from_clist:NN \l__tag_tmpb_seq \l__tag_tmpa_clist
```

we convert the names into pdf names with slash

```
      \seq_set_map_x:NNn \l__tag_tmpa_seq \l__tag_tmpb_seq
       {

# Part VIII
# The tagpdf-luatex.def Driver for luatex Part of the tagpdf package

```
⟨@@=tag⟩
⟨*luatex⟩
\ProvidesExplFile {tagpdf-luatex.def} {2022-08-24} {0.97}
  {tagpdf~driver~for~luatex}
```

## 1 Loading the lua

The space code requires that the fall back font has been loaded and initialized, so we force that first. But perhaps this could be done in the kernel.

```
{
  \fontencoding{TU}\fontfamily{lmr}\fontseries{m}\fontshape{n}\fontsize{10pt}{10pt}\selectfont
}
\lua_now:e { tagpdf=require('tagpdf.lua') }
```

The following defines wrappers around prop and seq commands to store the data also in lua tables. I probably want also lua tables I put them in the ltx.@@.tables namespaces The tables will be named like the variables but without backslash To access such a table with a dynamical name create a string and then use ltx.@@.tables[string] Old code, I'm not quite sure if this was a good idea. Now I have mix of table in ltx.@@.tables and ltx.@@.mc/struct. And a lot is probably not needed. TODO: this should be cleaned up, but at least roles are currently using the table!

__tag_prop_new:N
__tag_seq_new:N
__tag_prop_gput:Nnn
__tag_seq_gput_right:Nn
__tag_seq_item:cn
__tag_prop_item:cn
__tag_seq_show:N
__tag_prop_show:N

```
\cs_set_protected:Npn \__tag_prop_new:N #1
  {
    \prop_new:N #1
    \lua_now:e { ltx.__tag.tables.\cs_to_str:N#1 = {} }
  }

\cs_set_protected:Npn \__tag_seq_new:N #1
  {
    \seq_new:N #1
    \lua_now:e { ltx.__tag.tables.\cs_to_str:N#1 = {} }
  }

 }
```

(*End definition for* `\__tag_prop_new:N` *and others.*)

⟨/luatex⟩

## The module declaration

⟨∗lua⟩

```
-- tagpdf.lua
-- Ulrike Fischer

local ProvidesLuaModule = {
    name          = "tagpdf",
    version       = "0.97",       --TAGVERSION
    date          = "2022-08-24", --TAGDATE
    description   = "tagpdf lua code",
    license       = "The LATEX Project Public License 1.3c"
}

if luatexbase and luatexbase.provides_module then
  luatexbase.provides_module (ProvidesLuaModule)
end

--[[
```

```
The code has quite probably a number of problems
 - more variables should be local instead of global
 - the naming is not always consistent due to the development of the code
 - the traversing of the shipout box must be tested with more complicated setups
 - it should probably handle more node types
 -
--]]

```

Some comments about the lua structure.

```
--[[
the main table is named ltx.__tag. It contains the functions and also the data
collected during the compilation.

ltx.__tag.mc     will contain mc connected data.
ltx.__tag.struct will contain structure related data.
ltx.__tag.page   will contain page data
ltx.__tag.tables contains also data from mc and struct (from older code). This needs cleaning
             There are certainly dublettes, but I don't dare yet ...
ltx.__tag.func   will contain (public) functions.
ltx.__tag.trace  will contain tracing/loging functions.
local funktions starts with __
functions meant for users will be in ltx.tag

functions
 ltx.__tag.func.get_num_from (tag):    takes a tag (string) and returns the id number
 ltx.__tag.func.output_num_from (tag): takes a tag (string) and prints (to tex) the id number
 ltx.__tag.func.get_tag_from (num):    takes a num and returns the tag
 ltx.__tag.func.output_tag_from (num): takes a num and prints (to tex) the tag
 ltx.__tag.func.store_mc_data (num,key,data): stores key=data in ltx.__tag.mc[num]
 ltx.__tag.func.store_mc_label (label,num): stores label=num in ltx.__tag.mc.labels
 ltx.__tag.func.store_mc_kid (mcnum,kid,page): stores the mc-kids of mcnum on page page
 ltx.__tag.func.store_mc_in_page(mcnum,mcpagecnt,page): stores in the page table the number of
 ltx.__tag.func.store_struct_mcabs (structnum,mcnum): stores relations structnum<->mcnum (abs)
 ltx.__tag.func.mc_insert_kids (mcnum): inserts the /K entries for mcnum by wandering throught
 ltx.__tag.func.mark_page_elements(box,mcpagecnt,mccntprev,mcopen,name,mctypeprev) : the main
 ltx.__tag.func.mark_shipout (): a wrapper around the core function which inserts the last EMC
 ltx.__tag.func.fill_parent_tree_line (page): outputs the entries of the parenttree for this p
 ltx.__tag.func.output_parenttree(): outputs the content of the parenttree
 ltx.__tag.func.pdf_object_ref(name): outputs the object reference for the object name
 ltx.__tag.func.markspaceon(), ltx.__tag.func.markspaceoff(): (de)activates the marking of pos
 ltx.__tag.trace.show_mc_data (num,loglevel): shows ltx.__tag.mc[num] is the current log level
 ltx.__tag.trace.show_all_mc_data (max,loglevel): shows a maximum about mc's if the current lo
 ltx.__tag.trace.show_seq: shows a sequence (array)
 ltx.__tag.trace.show_struct_data (num): shows data of structure num
 ltx.__tag.trace.show_prop: shows a prop
 ltx.__tag.trace.log
 ltx.__tag.trace.showspaces : boolean
--]]

```

This set-ups the main attribute registers. The mc_type attribute stores the type (P, Span etc) encoded as a num, The mc_cnt attribute stores the absolute number and allows so to see if a node belongs to the same mc-chunk.

The interwordspace attr is set by the function `@@_mark_spaces`, and marks the place where spaces should be inserted. The interwordfont attr is set by the function `@@_mark_spaces` too and stores the font, so that we can decide which font to use for the real space char.

```
local mctypeattributeid  = luatexbase.new_attribute ("g__tag_mc_type_attr")
local mccntattributeid   = luatexbase.new_attribute ("g__tag_mc_cnt_attr")
local iwspaceattributeid = luatexbase.new_attribute ("g__tag_interwordspace_attr")
local iwfontattributeid  = luatexbase.new_attribute ("g__tag_interwordfont_attr")
```

with this token we can query the state of the boolean and so detect if unmarked nodes should be marked as attributes

```
local tagunmarkedbool= token.create("g__tag_tagunmarked_bool")
local truebool       = token.create("c_true_bool")
```

Now a number of local versions from global tables. Not all is perhaps needed, most node variants were copied from lua-debug.

```
local catlatex       = luatexbase.registernumber("catcodetable@latex")
local tableinsert    = table.insert
local nodeid           = node.id
local nodecopy         = node.copy
local nodegetattribute = node.get_attribute
local nodesetattribute = node.set_attribute
local nodehasattribute = node.has_attribute
local nodenew          = node.new
local nodetail         = node.tail
local nodeslide        = node.slide
local noderemove       = node.remove
local nodetraverseid   = node.traverse_id
local nodetraverse     = node.traverse
local nodeinsertafter  = node.insert_after
local nodeinsertbefore = node.insert_before
local pdfpageref       = pdf.pageref

local HLIST          = node.id("hlist")
local VLIST          = node.id("vlist")
local RULE           = node.id("rule")
local DISC           = node.id("disc")
local GLUE           = node.id("glue")
local GLYPH          = node.id("glyph")
local KERN           = node.id("kern")
local PENALTY        = node.id("penalty")
local LOCAL_PAR      = node.id("local_par")
local MATH           = node.id("math")
```

Now we setup the main table structure. ltx is used by other latex code too!

```
ltx             = ltx        or { }
ltx.__tag         = ltx.__tag        or { }
ltx.__tag.mc      = ltx.__tag.mc     or  { } -- mc data
ltx.__tag.struct  = ltx.__tag.struct or  { } -- struct data
ltx.__tag.tables  = ltx.__tag.tables or  { } -- tables created with new prop and new seq.
                                           -- wasn't a so great idea ...
                                           -- g__tag_role_tags_seq used by tag<-> is in this tabl
                                           -- used for pure lua tables too now!
ltx.__tag.page    = ltx.__tag.page   or  { } -- page data, currently only i->{0->mcnum,1->mcn
ltx.__tag.trace   = ltx.__tag.trace  or  { } -- show commands
```

```
ltx.__tag.func     = ltx.__tag.func   or  { } -- functions
ltx.__tag.conf     = ltx.__tag.conf   or  { } -- configuration variables
```

## 2 Logging functions

__tag_log
ltx.__tag.trace.log

This rather simple log function takes as argument a message (string) and a number and will output the message to the log/terminal if the current loglevel is greater or equal than num.

```
local __tag_log =
 function (message,loglevel)
  if (loglevel or 3) <= tex.count["l__tag_loglevel_int"] then
   texio.write_nl("tagpdf: ".. message)
  end
 end

ltx.__tag.trace.log = __tag_log
```

(*End definition for* `__tag_log` *and* `ltx.__tag.trace.log`.)

ltx.__tag.trace.show_seq

This shows the content of a seq as stored in the tables table. It is used by the `\@@_seq_show:N` function. It is not used in user commands, only for debugging, and so requires log level >0.

```
function ltx.__tag.trace.show_seq (seq)
 if (type(seq) == "table") then
  for i,v in ipairs(seq) do
   __tag_log ("[" .. i .. "] => " .. tostring(v),1)
  end
  else
   __tag_log ("sequence " .. tostring(seq) .. " not found",1)
  end
end
```

(*End definition for* `ltx.__tag.trace.show_seq`.)

__tag_pairs_prop
ltx.__tag.trace.show_prop

This shows the content of a prop as stored in the tables table. It is used by the `\@@_prop_show:N` function.

```
local __tag_pairs_prop =
 function  (prop)
      local a = {}
      for n in pairs(prop) do tableinsert(a, n) end
      table.sort(a)
      local i = 0                -- iterator variable
      local iter = function ()   -- iterator function
        i = i + 1
        if a[i] == nil then return nil
        else return a[i], prop[a[i]]
        end
      end
      return iter
  end

function ltx.__tag.trace.show_prop (prop)
```

```
 if (type(prop) == "table") then
  for i,v in __tag_pairs_prop (prop) do
    __tag_log ("[" .. i .. "] => " .. tostring(v),1)
  end
 else
   __tag_log ("prop " .. tostring(prop) .. " not found or not a table",1)
 end
 end
```

(*End definition for* `__tag_pairs_prop` *and* `ltx.__tag.trace.show_prop`.)

`ltx.__tag.trace.show_mc_data` This shows some data for a mc given by `num`. If something is shown depends on the log level. The function is used by the following function and then in `\ShowTagging`

```
function ltx.__tag.trace.show_mc_data (num,loglevel)
 if ltx.__tag and ltx.__tag.mc and ltx.__tag.mc[num] then
  for k,v in pairs(ltx.__tag.mc[num]) do
   __tag_log  ("mc"..num..": "..tostring(k).."=>"..tostring(v),loglevel)
  end
  if ltx.__tag.mc[num]["kids"] then
  __tag_log ("mc" .. num .. " has " .. #ltx.__tag.mc[num]["kids"] .. " kids",loglevel)
   for k,v in ipairs(ltx.__tag.mc[num]["kids"]) do
    __tag_log ("mc ".. num .. " kid "..k.." =>" .. v.kid.." on page " ..v.page,loglevel)
   end
  end
 else
  __tag_log  ("mc"..num.." not found",loglevel)
 end
end
```

(*End definition for* `ltx.__tag.trace.show_mc_data`.)

`ltx.__tag.trace.show_all_mc_data` This shows data for the mc's between `min` and `max` (numbers). It is used by the `\ShowTagging` function.

```
function ltx.__tag.trace.show_all_mc_data (min,max,loglevel)
 for i = min, max do
  ltx.__tag.trace.show_mc_data (i,loglevel)
 end
 texio.write_nl("")
end
```

(*End definition for* `ltx.__tag.trace.show_all_mc_data`.)

`ltx.__tag.trace.show_struct_data` This function shows some struct data. Unused but kept for debugging.

```
function ltx.__tag.trace.show_struct_data (num)
 if ltx.__tag and ltx.__tag.struct and ltx.__tag.struct[num] then
  for k,v in ipairs(ltx.__tag.struct[num]) do
   __tag_log  ("struct "..num..": "..tostring(k).."=>"..tostring(v),1)
  end
 else
  __tag_log   ("struct "..num.." not found ",1)
 end
end
```

(*End definition for* `ltx.__tag.trace.show_struct_data`.)

# 3 Helper functions

## 3.1 Retrieve data functions

__tag_get_mc_cnt_type_tag

This takes a node as argument and returns the mc-cnt, the mc-type and and the tag (calculated from the mc-cnt.

```
local __tag_get_mc_cnt_type_tag = function (n)
  local mccnt      =  nodegetattribute(n,mccntattributeid)  or -1
  local mctype     =  nodegetattribute(n,mctypeattributeid)  or -1
  local tag        =  ltx.__tag.func.get_tag_from(mctype)
  return mccnt,mctype,tag
end
```

(*End definition for* __tag_get_mc_cnt_type_tag.)

__tag_get_mathsubtype

This function allows to detect if we are at the begin or the end of math. It takes as argument a mathnode.

```
local function __tag_get_mathsubtype  (mathnode)
 if mathnode.subtype == 0 then
  subtype = "beginmath"
 else
  subtype = "endmath"
 end
 return subtype
end
```

(*End definition for* __tag_get_mathsubtype.)

ltx.__tag.tables.role_tag_attribute

The first is a table with key a tag and value a number (the attribute) The second is an array with the attribute value as key.

```
ltx.__tag.tables.role_tag_attribute = {}
ltx.__tag.tables.role_attribute_tag = {}
```

(*End definition for* ltx.__tag.tables.role_tag_attribute.)

ltx.__tag.func.alloctag

```
local __tag_alloctag =
 function (tag)
   if not ltx.__tag.tables.role_tag_attribute[tag] then
    table.insert(ltx.__tag.tables.role_attribute_tag,tag)
    ltx.__tag.tables.role_tag_attribute[tag]=#ltx.__tag.tables.role_attribute_tag
    __tag_log  ("Add "..tag.." "..ltx.__tag.tables.role_tag_attribute[tag],3)
   end
 end
ltx.__tag.func.alloctag = __tag_alloctag
```

(*End definition for* ltx.__tag.func.alloctag.)

__tag_get_num_from
ltx.__tag.func.get_num_from
ltx.__tag.func.output_num_from

These functions take as argument a string `tag`, and return the number under which is it recorded (and so the attribute value). The first function outputs the number for lua, while the `output` function outputs to tex.

```
local __tag_get_num_from =
 function (tag)
  if ltx.__tag.tables.role_tag_attribute[tag] then
```

```
    a= ltx.__tag.tables.role_tag_attribute[tag]
  else
    a= -1
  end
  return a
 end

ltx.__tag.func.get_num_from = __tag_get_num_from

function ltx.__tag.func.output_num_from (tag)
  local num = __tag_get_num_from (tag)
  tex.sprint(catlatex,num)
  if num == -1 then
   __tag_log ("Unknown tag "..tag.." used")
  end
end
```

(*End definition for* `__tag_get_num_from`, `ltx.__tag.func.get_num_from`, *and* `ltx.__tag.func.output_num_from`.)

`__tag_get_tag_from`
`ltx.__tag.func.get_tag_from`
`ltx.__tag.func.output_tag_from`

These functions are the opposites to the previous function: they take as argument a number (the attribute value) and return the string `tag`. The first function outputs the string for lua, while the `output` function outputs to tex.

```
local __tag_get_tag_from =
 function  (num)
  if ltx.__tag.tables.role_attribute_tag[num] then
   a = ltx.__tag.tables.role_attribute_tag[num]
  else
   a= "UNKNOWN"
  end
 return a
end

ltx.__tag.func.get_tag_from = __tag_get_tag_from

function ltx.__tag.func.output_tag_from (num)
  tex.sprint(catlatex,__tag_get_tag_from (num))
end
```

(*End definition for* `__tag_get_tag_from`, `ltx.__tag.func.get_tag_from`, *and* `ltx.__tag.func.output_tag_from`.)

`ltx.__tag.func.store_mc_data`

This function stores for `key`=`data` for mc-chunk `num`. It is used in the tagpdf-mc code, to store for example the tag string, and the raw options.

```
function ltx.__tag.func.store_mc_data (num,key,data)
 ltx.__tag.mc[num] = ltx.__tag.mc[num] or { }
 ltx.__tag.mc[num][key] = data
 __tag_log  ("INFO TEX-STORE-MC-DATA: "..num.." => "..tostring(key).." => "..tostring(data),3)
end
```

(*End definition for* `ltx.__tag.func.store_mc_data`.)

`ltx.__tag.func.store_mc_label`

This function stores the `label`=`num` relationship in the `labels` subtable. TODO: this is probably unused and can go.

```
function ltx.__tag.func.store_mc_label (label,num)
```

```
 ltx.__tag.mc["labels"] = ltx.__tag.mc["labels"] or { }
 ltx.__tag.mc.labels[label] = num
end
```

(*End definition for* `ltx.__tag.func.store_mc_label`.)

`ltx.__tag.func.store_mc_kid` This function is used in the traversing code. It stores a sub-chunk of a mc `mcnum` into the `kids` table.

```
function ltx.__tag.func.store_mc_kid (mcnum,kid,page)
 ltx.__tag.trace.log("INFO TAG-STORE-MC-KID: "..mcnum.." => " .. kid.." on page " .. page,3)
 ltx.__tag.mc[mcnum]["kids"] = ltx.__tag.mc[mcnum]["kids"] or { }
 local kidtable = {kid=kid,page=page}
 tableinsert(ltx.__tag.mc[mcnum]["kids"], kidtable )
end
```

(*End definition for* `ltx.__tag.func.store_mc_kid`.)

`ltx.__tag.func.mc_num_of_kids` This function returns the number of kids a mc `mcnum` has. We need to account for the case that a mc can have no kids.

```
function ltx.__tag.func.mc_num_of_kids (mcnum)
 local num = 0
 if ltx.__tag.mc[mcnum] and ltx.__tag.mc[mcnum]["kids"] then
   num = #ltx.__tag.mc[mcnum]["kids"]
 end
 ltx.__tag.trace.log ("INFO MC-KID-NUMBERS: " .. mcnum .. "has " .. num .. "KIDS",4)
 return num
end
```

(*End definition for* `ltx.__tag.func.mc_num_of_kids`.)

## 3.2 Functions to insert the pdf literals

`__tag_insert_emc_node` This insert the emc node.

```
local function __tag_insert_emc_node (head,current)
 local emcnode = nodenew("whatsit","pdf_literal")
       emcnode.data = "EMC"
       emcnode.mode=1
       head = node.insert_before(head,current,emcnode)
 return head
end
```

(*End definition for* `__tag_insert_emc_node`.)

`__tag_insert_bmc_node` This inserts a simple bmc node

```
local function __tag_insert_bmc_node (head,current,tag)
 local bmcnode = nodenew("whatsit","pdf_literal")
       bmcnode.data = "/"..tag.." BMC"
       bmcnode.mode=1
       head = node.insert_before(head,current,bmcnode)
 return head
end
```

(*End definition for* `__tag_insert_bmc_node`.)

__tag_insert_bdc_node This inserts a bcd node with a fix dict. TODO: check if this is still used, now that we create properties.

```
local function __tag_insert_bdc_node (head,current,tag,dict)
 local bdcnode = nodenew("whatsit","pdf_literal")
       bdcnode.data = "/"..tag.."<<"..dict..">> BDC"
       bdcnode.mode=1
       head = node.insert_before(head,current,bdcnode)
 return head
end
```

(*End definition for* `__tag_insert_bdc_node`.)

__tag_pdf_object_ref
ltx.__tag.func.pdf_object_ref This allows to reference a pdf object reserved with the l3pdf command by name. The return value is `n 0 R`, if the object doesn't exist, n is 0. TODO: is uses internal l3pdf commands, this should be properly supported by l3pdf

```
local function __tag_pdf_object_ref (name)
   local tokenname = 'c__pdf_backend_object_'..name..'_int'
   local object = token.create(tokenname).index..' 0 R'
   return object
end
ltx.__tag.func.pdf_object_ref=__tag_pdf_object_ref
```

(*End definition for* `__tag_pdf_object_ref` *and* `ltx.__tag.func.pdf_object_ref`.)

# 4 Function for the real space chars

__tag_show_spacemark A debugging function, it is used to inserts red color markers in the places where space chars can go, it can have side effects so not always reliable, but ok.

```
local function __tag_show_spacemark (head,current,color,height)
 local markcolor = color or "1 0 0"
 local markheight = height or 10
 local pdfstring = node.new("whatsit","pdf_literal")
       pdfstring.data =
       string.format("q "..markcolor.." RG "..markcolor.." rg 0.4 w 0 %g m 0 %g l S Q",-
3,markheight)
       head = node.insert_after(head,current,pdfstring)
 return head
end
```

(*End definition for* `__tag_show_spacemark`.)

__tag_fakespace
ltx.__tag.func.fakespace This is used to define a lua version of `\pdffakespace`

```
local function __tag_fakespace()
   tex.setattribute(iwspaceattributeid,1)
   tex.setattribute(iwfontattributeid,font.current())
end
ltx.__tag.func.fakespace = __tag_fakespace
```

(*End definition for* `__tag_fakespace` *and* `ltx.__tag.func.fakespace`.)

__tag_mark_spaces a function to mark up places where real space chars should be inserted. It only sets attributes, these are then be used in a later traversing which inserts the actual spaces. When space handling is activated this function is inserted in some callbacks.

```
--[[ a function to mark up places where real space chars should be inserted
     it only sets an attribute.
--]]

local function __tag_mark_spaces (head)
  local inside_math = false
  for n in nodetraverse(head) do
    local id = n.id
    if id == GLYPH then
      local glyph = n
      if glyph.next and (glyph.next.id == GLUE)
        and not inside_math  and (glyph.next.width >0)
      then
        nodesetattribute(glyph.next,iwspaceattributeid,1)
        nodesetattribute(glyph.next,iwfontattributeid,glyph.font)
      -- for debugging
       if ltx.__tag.trace.showspaces then
        __tag_show_spacemark (head,glyph)

end
```

(*End definition for* `__tag_mark_spaces`.)

`__tag_activate_mark_space`
`ltx.__tag.func.markspaceon`
`ltx.__tag.func.markspaceoff`

Theses functions add/remove the function which marks the spaces to the callbacks `pre_linebreak_filter` and `hpack_filter`

```
local function __tag_activate_mark_space ()
 if not luatexbase.in_callback ("pre_linebreak_filter","markspaces") then
  luatexbase.add_to_callback("pre_linebreak_filter",__tag_mark_spaces,"markspaces")
  luatexbase.add_to_callback("hpack_filter",__tag_mark_spaces,"markspaces")
 end
end

ltx.__tag.func.markspaceon=__tag_activate_mark_space

local function __tag_deactivate_mark_space ()
 if luatexbase.in_callback ("pre_linebreak_filter","markspaces") then
 luatexbase.remove_from_callback("pre_linebreak_filter","markspaces")
 luatexbase.remove_from_callback("hpack_filter","markspaces")
 end
end

ltx.__tag.func.markspaceoff=__tag_deactivate_mark_space
```

(*End definition for* `__tag_activate_mark_space`, `ltx.__tag.func.markspaceon`, *and* `ltx.__tag.func.markspaceoff`.)

We need two local variable to setup a default space char.

```
local default_space_char = node.new(GLYPH)
local default_fontid     = font.id("TU/lmr/m/n/10")
default_space_char.char  = 32
default_space_char.font  = default_fontid
```

`__tag_space_chars_shipout`
`ltx.__tag.func.space_chars_shipout`

These is the main function to insert real space chars. It inserts a glyph before every glue which has been marked previously. The attributes are copied from the glue, so if the tagging is done later, it will be tagged like it.

```
local function __tag_space_chars_shipout (box)
 local head = box.head
  if head then
    for n in node.traverse(head) do
      local spaceattr = nodegetattribute(n,iwspaceattributeid)  or -1
      if n.id == HLIST  then -- enter the hlist
         __tag_space_chars_shipout (n)
      elseif n.id == VLIST then -- enter the vlist
         __tag_space_chars_shipout (n)
      elseif n.id == GLUE then
        if ltx.__tag.trace.showspaces and spaceattr==1  then
          __tag_show_spacemark (head,n,"0 1 0")
        end
```

```
        if spaceattr==1  then
          local space
          local space_char = node.copy(default_space_char)
          local curfont    = nodegetattribute(n,iwfontattributeid)
          ltx.__tag.trace.log ("INFO SPACE-FUNCTION-FONT: ".. tostring(curfont),3)
          if curfont and luaotfload.aux.slot_of_name(curfont,"space") then
            space_char.font=curfont
          end
          head, space = node.insert_before(head, n, space_char) --
          n.width     = n.width - space.width
          space.attr  = n.attr
        end
      end
    end
  end
end

function ltx.__tag.func.space_chars_shipout (box)
  __tag_space_chars_shipout (box)
end
```

(*End definition for* `__tag_space_chars_shipout` *and* `ltx.__tag.func.space_chars_shipout`.)

# 5 Function for the tagging

`ltx.__tag.func.mc_insert_kids`

This is the main function to insert the K entry into a StructElem object. It is used in tagpdf-mc-luacode module. The `single` attribute allows to handle the case that a single mc on the tex side can have more than one kid after the processing here, and so we get the correct array/non array setup.

```
function ltx.__tag.func.mc_insert_kids (mcnum,single)
  if ltx.__tag.mc[mcnum] then
  ltx.__tag.trace.log("INFO TEX-MC-INSERT-KID-TEST: " .. mcnum,4)
   if ltx.__tag.mc[mcnum]["kids"] then
    if #ltx.__tag.mc[mcnum]["kids"] > 1 and single==1 then
     tex.sprint("[")
    end
    for i,kidstable in ipairs( ltx.__tag.mc[mcnum]["kids"] ) do
     local kidnum  = kidstable["kid"]
     local kidpage = kidstable["page"]
     local kidpageobjnum = pdfpageref(kidpage)
     ltx.__tag.trace.log("INFO TEX-MC-INSERT-KID: " .. mcnum ..
                         " insert KID " ..i..
                         " with num " .. kidnum ..
                         " on page " .. kidpage.."/"..kidpageobjnum,3)
     tex.sprint(catlatex,"<</Type /MCR /Pg "..kidpageobjnum .. " 0 R /MCID "..kidnum.. ">> " )
    end
    if #ltx.__tag.mc[mcnum]["kids"] > 1 and single==1 then
     tex.sprint("]")
    end
   else
    -- this is typically not a problem, e.g. empty hbox in footer/header can
    -- trigger this warning.
    ltx.__tag.trace.log("WARN TEX-MC-INSERT-NO-KIDS: "..mcnum.." has no kids",2)
```

```
    if single==1 then
      tex.sprint("null")
    end
   end
  else
   ltx.__tag.trace.log("WARN TEX-MC-INSERT-MISSING: "..mcnum.." doesn't exist",0)
  end
end
```

(*End definition for* `ltx.__tag.func.mc_insert_kids`.)

`ltx.__tag.func.store_struct_mcabs` This function is used in the tagpdf-mc-luacode. It store the absolute count of the mc into the current structure. This must be done ordered.

```
function ltx.__tag.func.store_struct_mcabs (structnum,mcnum)
 ltx.__tag.struct[structnum]=ltx.__tag.struct[structnum] or { }
 ltx.__tag.struct[structnum]["mc"]=ltx.__tag.struct[structnum]["mc"] or { }
 -- a structure can contain more than on mc chunk, the content should be ordered
 tableinsert(ltx.__tag.struct[structnum]["mc"],mcnum)
 ltx.__tag.trace.log("INFO TEX-MC-INTO-STRUCT: "..
                     mcnum.." inserted in struct "..structnum,3)
 -- but every mc can only be in one structure
 ltx.__tag.mc[mcnum]= ltx.__tag.mc[mcnum] or { }
 ltx.__tag.mc[mcnum]["parent"] = structnum
end

```

(*End definition for* `ltx.__tag.func.store_struct_mcabs`.)

`ltx.__tag.func.store_mc_in_page` This is used in the traversing code and stores the relation between abs count and page count.

```
-- pay attention: lua counts arrays from 1, tex pages from one
-- mcid and arrays in pdf count from 0.
function ltx.__tag.func.store_mc_in_page (mcnum,mcpagecnt,page)
 ltx.__tag.page[page] = ltx.__tag.page[page] or {}
 ltx.__tag.page[page][mcpagecnt] = mcnum
 ltx.__tag.trace.log("INFO TAG-MC-INTO-PAGE: page " .. page ..
                     ": inserting MCID " .. mcpagecnt .. " => " .. mcnum,3)
end
```

(*End definition for* `ltx.__tag.func.store_mc_in_page`.)

`ltx.__tag.func.mark_page_elements` This is the main traversing function. See the lua comment for more details.

```
--[[
    Now follows the core function
    It wades through the shipout box and checks the attributes
    ARGUMENTS
    box: is a box,
    mcpagecnt: num, the current page cnt of mc (should start at -1 in shipout box), needed fo
    mccntprev: num, the attribute cnt of the previous node/whatever - if different we have a c
    mcopen: num, records if some bdc/emc is open
    These arguments are only needed for log messages, if not present are replaces by fix stri
    name: string to describe the box
    mctypeprev: num, the type attribute of the previous node/whatever

    there are lots of logging messages currently. Should be cleaned up in due course.
```

```
    One should also find ways to make the function shorter.

⟨/lua⟩

# Part IX
# The tagpdf-roles module
# Tags, roles and namesspace code
# Part of the tagpdf package

add-new-tag␣(setup-key)
tag␣(rolemap-key)
namespace␣(rolemap-key)
role␣(rolemap-key)
role-namespace␣(rolemap-key)

The add-new-tag key can be used in \tagpdfsetup to declare and rolemap new tags. It takes as value a key-value list or a simple new-tag/old-tag.

The key-value list knows the following keys:

**tag** This is the name of the new tag as it should then be used in \tagstructbegin.

**namespace** This is the namespace of the new tag. The value should be a shorthand of a namespace. The allowed values are currently pdf, pdf2, mathml,latex, latex-book and user. The default value (and recommended value for a new tag) is user. The public name of the user namespace is tag/NS/user. This can be used to reference the namespace e.g. in attributes.

**role** This is the tag the tag should be mapped too. In a PDF 1.7 or earlier this is normally a tag from the pdf set, in PDF 2.0 from the pdf, pdf2 and mathml set. It can also be a user tag. The tag must be declared before, as the code retrieves the class of the new tag from it. The PDF format allows mapping to be done transitively. But tagpdf can't/won't check such unusual role mapping.

**role-namespace** If the role is a known tag the default value is the default namespace of this tag. With this key a specific namespace can be forced.

Namespaces are mostly a PDF 2.0 property, but it doesn't harm to set them also in a PDF 1.7 or earlier.

```

```

## 1 Code related to roles and structure names

```
⟨*package⟩
```

### 1.1 Variables

Tags are used in structures (\tagstructbegin) and mc-chunks (\tagmcbegin).

They have a name (a string), in lua a number (for the lua attribute), and in PDF 2.0 belong to one or more name spaces, with one being the default name space.

Tags of structures are classified, e.g. as grouping, inline or block level structure (and a few special classes like lists and tables), and must follow containments rules depending on their classification (for example a inline structure can not contain a block level structure). New tags inherit their classification from their rolemapping to the standard namespaces (`pdf` and/or `pdf2`). We store this classification as it will probably be needed for tests but currently the data is not much used. The classification for math (and the containment rules) is unclear currently and so not set.

The attribute number is only relevant in lua and only for the MC chunks (so tags with the same name from different names spaces can have the same number), and so only stored if luatex is detected.

Due to the namespaces the storing and processing of tags and there data are different in various places for PDF 2.0 and PDF <2.0, which makes things a bit difficult and leads to some duplications. Perhaps at some time there should be a clear split.

This are the main variables used by the code:

`\g__tag_role_tags_NS_prop` This is the core list of tag names. It uses tags as keys and the shorthand (e.g. pdf2, or mathml) of the default name space as value.

In pdf 2.0 the value is needed in the structure dictionaries.

`\g__tag_role_tags_class_prop` This contains for each tag a classification type. It is used in pdf <2.0.

`\g__tag_role_NS_prop` This contains the names spaces. The values are the object references. They are used in pdf 2.0.

`\g__tag_role_rolemap_prop` This contains for each tag the role to a standard tag. It is used in pdf<2.0 for tag checking and to fill at the end the RoleMap dictionary.

`g_@@_role/RoleMap_dict` This dictionary contains the standard rolemaps. It is relevant only for pdf <2.0.

`\g__tag_role_NS_<ns>_prop` This prop contains the tags of a name space and their role. The props are also use for remapping. As value they contain two brace groups: tag and namespace. In pdf <2.0 the namespace is empty.

`\g__tag_role_NS_<ns>_class_prop` This prop contains the tags of a name space and their type. The value is only needed for pdf 2.0.

`\g__tag_role_index_prop` This prop contains the standard tags (pdf in pdf<2.0, pdf,pdf2 + mathml in pdf 2.0) as keys, the values are a two-digit number. These numbers are used to get the containment rule of two tags from the intarray.

`\l__tag_role_debug_prop` This property is used to pass some info around for info messages or debugging.

`\g__tag_role_tags_NS_prop` This is the core list of tag names. It uses tags as keys and the shorthand (e.g. pdf2, or mathml) of the default name space as value. We store the default name space also in pdf <2.0, even if not needed: it doesn't harm and simplifies the code. There is no need to access this from lua, so we use the standard prop commands.

```
\prop_new:N    \g__tag_role_tags_NS_prop
```

(*End definition for* `\g__tag_role_tags_NS_prop`.)

`\g__tag_role_tags_class_prop` With pdf 2.0 we store the class in the NS dependant props. With pdf <2.0 we store for now the type(s) of a tag in a common prop. Tags that are rolemapped should get the type from the target.

```
\prop_new:N     \g__tag_role_tags_class_prop
```

(*End definition for* `\g__tag_role_tags_class_prop`.)

`\g__tag_role_NS_prop` This holds the list of supported name spaces. The keys are the name tagpdf will use, the values the object reference. The urls identifier are stored in related dict object.

**mathml** http://www.w3.org/1998/Math/MathML

**pdf2** http://iso.org/pdf2/ssn

**pdf** http://iso.org/pdf/ssn (default)

**user** `\c__tag_role_userNS_id_str` (random id, for user tags)

**latex** https://www.latex-project.org/ns/dflt/2022

**latex-book** https://www.latex-project.org/ns/book/2022

**latex-inline** https://www.latex-project.org/ns/inline/2022

More namespaces are possible and their objects references and their rolemaps must be collected so that an array can be written to the StructTreeRoot at the end (see tagpdf-tree). We use a prop to store the object reference as it will be needed rather often.

```
\prop_new:N \g__tag_role_NS_prop
```

(*End definition for* `\g__tag_role_NS_prop`.)

`\g__tag_role_index_prop` This prop contains the standard tags (pdf in pdf<2.0, pdf,pdf2 + mathml in pdf 2.0) as keys, the values are a two-digit number. These numbers are used to get the containment rule of two tags from the intarray.

```
\prop_new:N \g__tag_role_index_prop
```

(*End definition for* `\g__tag_role_index_prop`.)

`\l__tag_role_debug_prop` This variable is used to pass more infos to debug messages.

```
\prop_new:N \l__tag_role_debug_prop
```

(*End definition for* `\l__tag_role_debug_prop`.)

We need also a bunch of temporary variables.

`\l__tag_role_tag_tmpa_tl`
`\l__tag_role_tag_namespace_tmpa_tl`
`\l__tag_role_role_tmpa_tl`
`\l__tag_role_role_namespace_tmpa_tl`
`\l__tag_role_tmpa_seq`

```
\tl_new:N \l__tag_role_tag_tmpa_tl
\tl_new:N \l__tag_role_tag_namespace_tmpa_tl
\tl_new:N \l__tag_role_role_tmpa_tl
\tl_new:N \l__tag_role_role_namespace_tmpa_tl
\seq_new:N\l__tag_role_tmpa_seq
```

(*End definition for* `\l__tag_role_tag_tmpa_tl` *and others.*)

## 1.2 Namespaces

The following commands setups a name space. With pdf version <2.0 this is only a prop with the rolemap. With pdf 2.0 a dictionary must be set up. Such a name space dictionaries can contain an optional /Schema and /RoleMapNS entry. We only reserve the objects but delay the writing to the finish code, where we can test if the keys and the name spaces are actually needed. This commands setups objects for the name space and its rolemap. It also initialize a dict to collect the rolemaps if needed, and a property with the tags of the name space and their rolemapping for loops. It is unclear if a reference to a schema file will be ever needed, but it doesn't harm ....

g__tag_role/RoleMap_dict
\g__tag_role_rolemap_prop

This is the object which contains the normal RoleMap. It is probably not needed in pdf 2.0 but currently kept.

```
\pdfdict_new:n {g__tag_role/RoleMap_dict}
\prop_new:N \g__tag_role_rolemap_prop
```

(*End definition for* g__tag_role/RoleMap_dict *and* \g__tag_role_rolemap_prop.)

__tag_role_NS_new:nnn __tag_role_NS_new:nnn{⟨*shorthand*⟩}{⟨*URI-ID*⟩}Schema

__tag_role_NS_new:nnn

```
\pdf_version_compare:NnTF < {2.0}
 {
   \cs_new_protected:Npn \__tag_role_NS_new:nnn #1 #2 #3
    {
      \prop_new:c { g__tag_role_NS_#1_prop }
      \prop_new:c { g__tag_role_NS_#1_class_prop }
      \prop_gput:Nnx \g__tag_role_NS_prop {#1}{}
    }
 }
 {
  \cs_new_protected:Npn \__tag_role_NS_new:nnn #1 #2 #3
    {
      \prop_new:c { g__tag_role_NS_#1_prop }
      \prop_new:c { g__tag_role_NS_#1_class_prop }
      \pdf_object_new:n {tag/NS/#1}
      \pdfdict_new:n     {g__tag_role/Namespace_#1_dict}
      \pdf_object_new:n {__tag/RoleMapNS/#1}
      \pdfdict_new:n     {g__tag_role/RoleMapNS_#1_dict}
      \pdfdict_gput:nnn
        {g__tag_role/Namespace_#1_dict}
        {Type}
        {/Namespace}
      \pdf_string_from_unicode:nnN{utf8/string}{#2}\l__tag_tmpa_str
      \tl_if_empty:NF \l__tag_tmpa_str
        {
          \pdfdict_gput:nnx
            {g__tag_role/Namespace_#1_dict}
            {NS}
            {\l__tag_tmpa_str}
        }
      %RoleMapNS is added in tree
      \tl_if_empty:nF  {#3}
```

```
      {
        \pdfdict_gput:nnx{g__tag_role/Namespace_#1_dict}
         {Schema}{#3}
      }
     \prop_gput:Nnx \g__tag_role_NS_prop {#1}{\pdf_object_ref:n{tag/NS/#1}~}
   }
}
```

(*End definition for* `\__tag_role_NS_new:nnn`.)

We need an id for the user space. For the tests it should be possible to set it to a fix value. So we use random numbers which can be fixed by setting a seed. We fake a sort of GUID but do not try to be really exact as it doesn't matter ...

`\c__tag_role_userNS_id_str`

```
\str_const:Nx \c__tag_role_userNS_id_str
  { data:,
    \int_to_Hex:n{\int_rand:n {65535}}
    \int_to_Hex:n{\int_rand:n {65535}}
    -
    \int_to_Hex:n{\int_rand:n {65535}}
    -
    \int_to_Hex:n{\int_rand:n {65535}}
    -
    \int_to_Hex:n{\int_rand:n {65535}}
    -
    \int_to_Hex:n{\int_rand:n {16777215}}
    \int_to_Hex:n{\int_rand:n {16777215}}
  }
```

(*End definition for* `\c__tag_role_userNS_id_str`.)

Now we setup the standard names spaces. The mathml space is currently only loaded for pdf 2.0.

```
\__tag_role_NS_new:nnn {pdf}   {http://iso.org/pdf/ssn}{}
\__tag_role_NS_new:nnn {pdf2}  {http://iso.org/pdf2/ssn}{}
\pdf_version_compare:NnF < {2.0}
  {
    \__tag_role_NS_new:nnn {mathml}{http://www.w3.org/1998/Math/MathML}{}
  }
\__tag_role_NS_new:nnn {latex} {https://www.latex-project.org/ns/dflt/2022}{}
\__tag_role_NS_new:nnn {latex-book} {https://www.latex-project.org/ns/book/2022}{}
\__tag_role_NS_new:nnn {latex-inline} {https://www.latex-project.org/ns/inline/2022}{}
\exp_args:Nnx
  \__tag_role_NS_new:nnn {user}{\c__tag_role_userNS_id_str}{}
```

## 1.3 Adding a new tag

Both when reading the files and when setting up a tag manually we have to store data in various places.

`\__tag_role_alloctag:nnn` This command allocates a new tag without role mapping. In the lua backend it will also record the attribute value.

```
\pdf_version_compare:NnTF < {2.0}
  {
```

```
  \sys_if_engine_luatex:TF
   {
     \cs_new_protected:Npn \__tag_role_alloctag:nnn #1 #2 #3 %#1 tagname, ns, type
      {
        \lua_now:e { ltx.__tag.func.alloctag ('#1') }
        \prop_gput:Nnn \g__tag_role_tags_NS_prop   {#1}{#2}
        \prop_gput:cnn {g__tag_role_NS_#2_prop}  {#1}{{}{}}
        \prop_gput:Nnn \g__tag_role_tags_class_prop {#1}{#3}
        \prop_gput:cnn {g__tag_role_NS_#2_class_prop}  {#1}{--UNUSED--}
      }
   }
   {
     \cs_new_protected:Npn \__tag_role_alloctag:nnn #1 #2 #3
      {
        \prop_gput:Nnn \g__tag_role_tags_NS_prop   {#1}{#2}
        \prop_gput:cnn {g__tag_role_NS_#2_prop}  {#1}{{}{}}
        \prop_gput:Nnn \g__tag_role_tags_class_prop {#1}{#3}
        \prop_gput:cnn {g__tag_role_NS_#2_class_prop}  {#1}{--UNUSED--}
      }
   }
  }
  {
   \sys_if_engine_luatex:TF
    {
      \cs_new_protected:Npn \__tag_role_alloctag:nnn #1 #2 #3 %#1 tagname, ns, type
       {
         \lua_now:e { ltx.__tag.func.alloctag ('#1') }
         \prop_gput:Nnn \g__tag_role_tags_NS_prop   {#1}{#2}
         \prop_gput:cnn {g__tag_role_NS_#2_prop}  {#1}{{}{}}
         \prop_gput:Nnn \g__tag_role_tags_class_prop {#1}{--UNUSED--}
         \prop_gput:cnn {g__tag_role_NS_#2_class_prop}  {#1}{#3}
       }
    }
    {
      \cs_new_protected:Npn \__tag_role_alloctag:nnn #1 #2 #3
       {
         \prop_gput:Nnn \g__tag_role_tags_NS_prop   {#1}{#2}
         \prop_gput:cnn {g__tag_role_NS_#2_prop}  {#1}{{}{}}
         \prop_gput:Nnn \g__tag_role_tags_class_prop {#1}{--UNUSED--}
         \prop_gput:cnn {g__tag_role_NS_#2_class_prop}  {#1}{#3}
       }
    }
  }
\cs_generate_variant:Nn  \__tag_role_alloctag:nnn {nnV}
```

(*End definition for* `\__tag_role_alloctag:nnn`.)

### 1.3.1 pdf 1.7 and earlier

`\__tag_role_add_tag:nn` The pdf 1.7 version has only two arguments: new and rolemap name. The role must be an existing tag and should not be empty. We allow to change the role of an existing tag: as the rolemap is written at the end not confusion can happen.

```
\cs_new_protected:Nn \__tag_role_add_tag:nn % (new) name, reference to old
  {
```

checks and messages

```
    \__tag_check_add_tag_role:nn {#1}{#2}
    \prop_if_in:NnF \g__tag_role_tags_NS_prop {#1}
      {
        \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
          {
            \msg_info:nnn { tag }{new-tag}{#1}
          }
      }
```

now the addition

```
    \prop_get:NnN \g__tag_role_tags_class_prop {#2}\l__tag_tmpa_tl
    \quark_if_no_value:NT \l__tag_tmpa_tl
      {
        \tl_set:Nn\l__tag_tmpa_tl{--UNKNOWN--}
      }
    \__tag_role_alloctag:nnV {#1}{user}\l__tag_tmpa_tl
```

We resolve rolemapping recursively so that all targets are stored as standard tags.

```
    \tl_if_empty:nF { #2 }
      {
        \prop_get:NnN \g__tag_role_rolemap_prop {#2}\l__tag_tmpa_tl
        \quark_if_no_value:NTF \l__tag_tmpa_tl
          {
            \prop_gput:Nnx \g__tag_role_rolemap_prop {#1}{\tl_to_str:n{#2}}
          }
          {
            \prop_gput:NnV \g__tag_role_rolemap_prop {#1}\l__tag_tmpa_tl
          }
      }
  }
\cs_generate_variant:Nn \__tag_role_add_tag:nn {VV,ne}
```

(*End definition for* `\__tag_role_add_tag:nn`.)

### 1.3.2 The pdf 2.0 version

`\__tag_role_add_tag:nnnn` The pdf 2.0 version takes four arguments: tag/namespace/role/namespace

```
\cs_new_protected:Nn \__tag_role_add_tag:nnnn %tag/namespace/role/namespace
  {
    \__tag_check_add_tag_role:nnn {#1/#2}{#3}{#4}
    \int_compare:nNnT {\l__tag_loglevel_int} > { 0 }
      {
        \msg_info:nnn { tag }{new-tag}{#1}
      }
    \prop_get:cnN { g__tag_role_NS_#4_class_prop } {#3}\l__tag_tmpa_tl
    \quark_if_no_value:NT \l__tag_tmpa_tl
      {
        \tl_set:Nn\l__tag_tmpa_tl{--UNKNOWN--}
      }
    \__tag_role_alloctag:nnV {#1}{#2}\l__tag_tmpa_tl
    \pdfdict_gput:nnx {g__tag_role/RoleMapNS_#2_dict}{#1}
       {
         [
           \pdf_name_from_unicode_e:n{#3}
```

```
            \c_space_tl
            \pdf_object_ref:n {tag/NS/#4}
          ]
        }
```

We resolve rolemapping recursively so that all targets are stored as standard tags for the tests.

```
    \tl_if_empty:nF { #2 }
      {
        \prop_get:cnN { g__tag_role_NS_#4_prop } {#3}\l__tag_tmpa_tl
        \quark_if_no_value:NTF \l__tag_tmpa_tl
          {
            \prop_gput:cnx { g__tag_role_NS_#2_prop } {#1}
              {{\tl_to_str:n{#3}}{\tl_to_str:n{#4}}}
          }
          {
            \prop_gput:cno { g__tag_role_NS_#2_prop } {#1}{\l__tag_tmpa_tl}
          }
      }
  }
\cs_generate_variant:Nn \__tag_role_add_tag:nnnn {VVVV}
```

(*End definition for* `\__tag_role_add_tag:nnnn`.)

## 1.4 Helper command to read the data from files

In this section we setup the helper command to read namespace files.

`\__tag_role_read_namespace_line:nw`

This command will process a line in the name space file. The first argument is the name of the name space. The definition differ for pdf 2.0. as we have proper name spaces there. With pdf<2.0 not special name spaces shouldn't update the default role or add to the rolemap again. We use a boolean here.

```
\bool_new:N\l__tag_role_update_bool
\bool_set_true:N \l__tag_role_update_bool

\pdf_version_compare:NnTF < {2.0}
 {
  \cs_new_protected:Npn \__tag_role_read_namespace_line:nw #1#2,#3,#4,#5,#6\q_stop %
   % #1 NS, #2 tag, #3 rolemap, #4 NS rolemap #5 type
    {
      \tl_if_empty:nF { #2 }
       {
        \bool_if:NTF \l__tag_role_update_bool
         {
          \tl_if_empty:nTF {#5}
            {
              \prop_get:NnN \g__tag_role_tags_class_prop  {#3}\l__tag_tmpa_tl
              \quark_if_no_value:NT \l__tag_tmpa_tl
                {
                  \tl_set:Nn\l__tag_tmpa_tl{--UNKNOWN--}
                }
            }
            {
              \tl_set:Nn \l__tag_tmpa_tl {#5}
            }
```

```
          \__tag_role_alloctag:nnV {#2}{#1}\l__tag_tmpa_tl
          \tl_if_empty:nF {#3}
           {
            \__tag_role_add_tag:nn {#2}{#3}
           }
          \prop_gput:cnn {g__tag_role_NS_#1_prop}  {#2}{{#3}{}}
         }
         {
           \prop_gput:cnn {g__tag_role_NS_#1_prop}  {#2}{{#3}{}}
           \prop_gput:cnn {g__tag_role_NS_#1_class_prop}  {#2}{--UNUSED--}
         }
       }
    }
  }
  {
    \cs_new_protected:Npn \__tag_role_read_namespace_line:nw #1#2,#3,#4,#5,#6\q_stop %
     % #1 NS, #2 tag, #3 rolemap, #4 NS rolemap #5 type
     {
       \tl_if_empty:nF {#2}
        {
         \tl_if_empty:nTF {#5}
          {
            \prop_get:cnN { g__tag_role_NS_#4_class_prop } {#3}\l__tag_tmpa_tl
            \quark_if_no_value:NT \l__tag_tmpa_tl
              {
                \tl_set:Nn\l__tag_tmpa_tl{--UNKNOWN--}
              }
          }
          {
            \tl_set:Nn \l__tag_tmpa_tl {#5}
          }
         \__tag_role_alloctag:nnV {#2}{#1}\l__tag_tmpa_tl
         \bool_lazy_and:nnT
            { ! \tl_if_empty_p:n {#3} }{! \str_if_eq_p:nn {#1}{pdf2}}
            {
             \__tag_role_add_tag:nnnn {#2}{#1}{#3}{#4}
             \prop_gput:cnn {g__tag_role_NS_#1_prop}  {#2}{{#3}{#4}}
            }
       }
     }
  }
```

(*End definition for* `\__tag_role_read_namespace_line:nw`.)

`\__tag_role_read_namespace:n` This command reads the namespace file.

```
\cs_new_protected:Npn \__tag_role_read_namespace:n #1 %name of namespace
  {
    \prop_if_exist:cF {g__tag_role_NS_#1_prop}
      { \msg_warning:nnn {tag}{namespace-unknown}{#1} }
    \file_if_exist:nTF { tagpdf-ns-#1.def}
     {
       \ior_open:Nn \g_tmpa_ior {tagpdf-ns-#1.def}
       \msg_info:nnn {tag}{read-namespace}{#1}
       \ior_map_inline:Nn \g_tmpa_ior
```

```
        {
          \__tag_role_read_namespace_line:nw {#1} ##1,,,,\q_stop
        }
      \ior_close:N\g_tmpa_ior
    }
    {
     \msg_warning:nnn{tag}{namespace-missing}{#1}
    }
}

```

(*End definition for* `\__tag_role_read_namespace:n`.)

## 1.5 Reading the default data

The order is important as we want pdf2 and latex as default.

```
\__tag_role_read_namespace:n {pdf}
\__tag_role_read_namespace:n {pdf2}
\pdf_version_compare:NnF < {2.0}
  {\__tag_role_read_namespace:n {mathml}}
\bool_set_false:N\l__tag_role_update_bool
\__tag_role_read_namespace:n {latex-inline}
\__tag_role_read_namespace:n {latex-book}
\bool_set_true:N\l__tag_role_update_bool
\__tag_role_read_namespace:n {latex}
\__tag_role_read_namespace:n {pdf}
\__tag_role_read_namespace:n {pdf2}
```

But is the class provides a `\chapter` command then we switch

```
\pdf_version_compare:NnTF < {2.0}
  {
    \hook_gput_code:nnn {begindocument}{tagpdf}
      {
        \cs_if_exist:NT \chapter
           {
             \prop_map_inline:cn{g__tag_role_NS_latex-book_prop}
               {
                 \__tag_role_add_tag:ne {#1}{\use_i:nn #2\c_empty_tl\c_empty_tl}
               }
           }
      }
  }
  {
    \hook_gput_code:nnn {begindocument}{tagpdf}
      {
        \cs_if_exist:NT \chapter
         {
           \prop_map_inline:cn{g__tag_role_NS_latex-book_prop}
             {
               \prop_gput:Nnn \g__tag_role_tags_NS_prop    { #1 }{ latex-book }
             }
         }
      }
  }
```

## 1.6 Parent-child rules

PDF define various rules about which tag can be a child of another tag. The following code implements the matrix to allow to use it in tests.

\g__tag_role_parent_child_intarray

This intarray will store the rule as a number. For parent nm and child ij (n,m,i,j digits) the rule is at position nmij. As we have around 56 tags, we need roughly a size 6000.

```
\intarray_new:Nn \g__tag_role_parent_child_intarray {6000}
```

(*End definition for* `\g__tag_role_parent_child_intarray`.)

\c__tag_role_rules_prop
\c__tag_role_rules_num_prop

These two properties map the rule strings to numbers and back. There are in tagpdf-data.dtx near the csv files for easier maintenance.

(*End definition for* `\c__tag_role_rules_prop` *and* `\c__tag_role_rules_num_prop`.)

__tag_store_parent_child_rule:nnn

The helper command is used to store the rule. It assumes that parent and child are given as 2-digit number!

```
\cs_new_protected:Npn \__tag_store_parent_child_rule:nnn #1 #2 #3 % num parent, num child, #3
  {
    \intarray_gset:Nnn \g__tag_role_parent_child_intarray
      { #1#2 }{0\prop_item:Nn\c__tag_role_rules_prop{#3}}
  }
```

(*End definition for* `\__tag_store_parent_child_rule:nnn`.)

### 1.6.1 Reading in the csv-files

This counter will be used to identify the first (non-comment) line

```
\int_zero:N  \l__tag_tmpa_int
```

Open the file depending on the PDF version

```
\pdf_version_compare:NnTF < {2.0}
  {
    \ior_open:Nn \g_tmpa_ior {tagpdf-parent-child.csv}
  }
  {
    \ior_open:Nn \g_tmpa_ior {tagpdf-parent-child-2.csv}
  }
```

Now the main loop over the file

```
\ior_map_inline:Nn \g_tmpa_ior
  {
```

ignore lines containing only comments

```
    \tl_if_empty:nF{#1}
      {
```

count the lines ...

```
        \int_incr:N\l__tag_tmpa_int
```

put the line into a seq. Attention! empty cells are dropped.

```
        \seq_set_from_clist:Nn\l__tag_tmpa_seq { #1 }
        \int_compare:nNnTF {\l__tag_tmpa_int}=1
```

This handles the header line. It gives the tags 2-digit numbers

```
          {
            \seq_map_indexed_inline:Nn \l__tag_tmpa_seq
              {
                \prop_gput:Nnx\g__tag_role_index_prop
                  {##2}
                  {\int_compare:nNnT{##1}<{10}{0}##1}
              }
          }
```

now the data lines.

```
        {
          \seq_set_from_clist:Nn\l__tag_tmpa_seq { #1 }
```

get the name of the child tag from the first column

```
          \seq_pop_left:NN\l__tag_tmpa_seq\l__tag_tmpa_tl
```

get the number of the child, and store it in `\l__tag_tmpb_tl`

```
          \prop_get:NVN \g__tag_role_index_prop \l__tag_tmpa_tl \l__tag_tmpb_tl
```

remove column 2+3

```
          \seq_pop_left:NN\l__tag_tmpa_seq\l__tag_tmpa_tl
          \seq_pop_left:NN\l__tag_tmpa_seq\l__tag_tmpa_tl
```

Now map over the rest. The index `##1` gives us the number of the parent, `##2` is the data.

```
          \seq_map_indexed_inline:Nn \l__tag_tmpa_seq
            {
              \exp_args:Nnx
              \__tag_store_parent_child_rule:nnn {##1}{\l__tag_tmpb_tl}{ ##2 }
            }
        }
    }
}
```

close the read handle.

```
\ior_close:N\g_tmpa_ior
```

The Root, Hn and mathml tags are special and need to be added explicitly

```
\prop_get:NnN\g__tag_role_index_prop{StructTreeRoot}\l__tag_tmpa_tl
\prop_gput:Nnx\g__tag_role_index_prop{Root}{\l__tag_tmpa_tl}
\prop_get:NnN\g__tag_role_index_prop{Hn}\l__tag_tmpa_tl
\pdf_version_compare:NnTF < {2.0}
  {
    \int_step_inline:nn{6}
      {
        \prop_gput:Nnx\g__tag_role_index_prop{H#1}{\l__tag_tmpa_tl}
      }
  }
  {
    \int_step_inline:nn{10}
      {
        \prop_gput:Nnx\g__tag_role_index_prop{H#1}{\l__tag_tmpa_tl}
      }
```

all mathml tags are currently handled identically

```
    \prop_get:NnN\g__tag_role_index_prop {mathml}\l__tag_tmpa_tl
    \prop_get:NnN\g__tag_role_index_prop {math}\l__tag_tmpb_tl
    \prop_map_inline:Nn \g__tag_role_NS_mathml_prop
      {
        \prop_gput:NnV\g__tag_role_index_prop{#1}\l__tag_tmpa_tl
      }
    \prop_gput:NnV\g__tag_role_index_prop{math}\l__tag_tmpb_tl
  }
```

### 1.6.2 Retrieving the parent-child rule

\l__tag_role_real_parent_tl

Part, Div and NonStruct have no own rules, instead the parent(s) have to be inspected. To store this real parent we use this tlvar

```
\tl_new:N \l__tag_role_real_parent_tl
```

(*End definition for* `\l__tag_role_real_parent_tl`.)

__tag_role_get_parent_child_rule:nnN

This command retrieves the rule (as a number) and stores it in the tl-var. TODO check temporary variables. Check if the tl-var should be fix. The arguments should be standard tags for which a rule exist and role mapping should have already be done.

```
\tl_new:N \l__tag_parent_child_check_tl
\cs_new_protected:Npn \__tag_role_get_parent_child_rule:nnN #1 #2 #3
  % #1 parent (string) #2 child (string) #3 tl for state
  {
     \tl_set:Nn \l__tag_role_real_parent_tl {#1}

     \prop_get:NnN \g__tag_role_index_prop{#1}\l__tag_tmpa_tl
     \prop_get:NnN \g__tag_role_index_prop{#2}\l__tag_tmpb_tl
     \bool_lazy_and:nnTF
       { ! \quark_if_no_value_p:N \l__tag_tmpa_tl }
       { ! \quark_if_no_value_p:N \l__tag_tmpb_tl }
       {
```

Get the rule from the intarray

```
         \tl_set:Nx#3
           {
             \intarray_item:Nn
              \g__tag_role_parent_child_intarray
              {\l__tag_tmpa_tl\l__tag_tmpb_tl}
           }
```

If the state is  we have to check the parents from the stack and use the first which is not Part, Div or NonStruct

```
         \int_compare:nNnT
           {#3} = {\prop_item:Nn\c__tag_role_rules_prop{}}
           {
             \seq_set_eq:NN   \l__tag_role_tmpa_seq \g__tag_struct_tag_stack_seq
```

we must take the current child from the stack if is already there, depending on location the check is called, this could also remove the parent, but that is ok too.

```
             \seq_pop_left:NN \l__tag_role_tmpa_seq\l__tag_get_tmpc_tl
             \seq_map_inline:Nn\l__tag_role_tmpa_seq
               {
                 \tl_if_in:nnF {-Part-Div-NonStruct-}{-##1-}
```

```
                {
                  \tl_set:Nn\l__tag_role_real_parent_tl {##1}
                  \int_zero:N\l__tag_tmpa_int
                  \__tag_role_get_parent_child_rule:nnN {##1}{#2}#3
                  \int_set:Nn\l__tag_tmpa_int{1}
                  \seq_map_break:
                }
            }
        }
```

This is the message, this can perhaps go into debug mode.

```
        \group_begin:
        \int_compare:nNnT {\l__tag_tmpa_int*\l__tag_loglevel_int} > { 0 }
          {
            \prop_get:NVNF\c__tag_role_rules_num_prop #3 \l__tag_tmpa_tl
              {
                \tl_set:Nn \l__tag_tmpa_tl {unknown}
              }
            \tl_set:Nn \l__tag_tmpb_tl {#1}
            \msg_note:nnxxx
              { tag }
              { role-parent-child }
              { #1
                \tl_if_eq:NNTF\l__tag_tmpb_tl\l__tag_role_real_parent_tl
                  {
                    \bool_lazy_and:nnT
                     {
                       \prop_if_in_p:Nn \l__tag_role_debug_prop {parent}
                     }
                     {
                       !\str_if_eq_p:ee {#1}{\prop_item:Nn\l__tag_role_debug_prop {parent}}
                     }
                     {
                       \c_space_tl (from~\prop_item:Nn\l__tag_role_debug_prop {parent})
                     }
                  }
                  {
                    \c_space_tl(inherited~from~\l__tag_role_real_parent_tl)
                  }
              }
              {
                #2
                \bool_lazy_and:nnT
                  {
                    \prop_if_in_p:Nn \l__tag_role_debug_prop {child}
                  }
                  {
                    !\str_if_eq_p:ee {#2}{\prop_item:Nn\l__tag_role_debug_prop {child}}
                  }
                  {
                    \c_space_tl (from~\prop_item:Nn\l__tag_role_debug_prop {child})
                  }
              }
              { '#3~(\l__tag_tmpa_tl)' }
          }
```

```
            \group_end:
        }
        {
          \tl_set:Nn#3 {0}
          \msg_warning:nnxxx
            { tag }
            {role-parent-child}
            { #1 }
            { #2 }
            { unknown! }
        }
  }
\cs_generate_variant:Nn\__tag_role_get_parent_child_rule:nnN {VVN}
```

(*End definition for* `\__tag_role_get_parent_child_rule:nnN`.)

`__tag_check_parent_child:nnnnN` This is the main command. It has to retrieve the standard tags for a comparison. In pdf 2.0 the name spaces of the tags are relevant, so we have arguments for them, but in pdf <2.0 they are ignored and can be left empty.

```
\pdf_version_compare:NnTF < {2.0}
  {
   \cs_new_protected:Npn \__tag_check_parent_child:nnnnN #1 #2 #3 #4 #5
     {
```

for debugging messages we store the arguments.

```
        \prop_put:Nnn \l__tag_role_debug_prop {parent} {#1}
        \prop_put:Nnn \l__tag_role_debug_prop {child}  {#3}
```

get the standard tags through rolemapping if needed at first the parent

```
        \prop_get:NnNTF \g__tag_role_index_prop {#1}\l__tag_tmpa_tl
          {
            \tl_set:Nn \l__tag_tmpa_tl {#1}
          }
          {
            \prop_get:NnNF \g__tag_role_rolemap_prop {#1}\l__tag_tmpa_tl
              {
                \tl_set:Nn \l__tag_tmpa_tl {\q_no_value}
              }
          }
```

now the child

```
        \prop_get:NnNTF \g__tag_role_index_prop {#3}\l__tag_tmpb_tl
          {
            \tl_set:Nn \l__tag_tmpb_tl {#3}
          }
          {
            \prop_get:NnNF \g__tag_role_rolemap_prop {#3}\l__tag_tmpb_tl
              {
                \tl_set:Nn \l__tag_tmpb_tl {\q_no_value}
              }
          }
```

if we got tags for parent and child we call the checking command

```
        \bool_lazy_and:nnTF
          { ! \quark_if_no_value_p:N \l__tag_tmpa_tl }
          { ! \quark_if_no_value_p:N \l__tag_tmpb_tl }
```

```
499         {
500           \__tag_role_get_parent_child_rule:VVN \l__tag_tmpa_tl \l__tag_tmpb_tl #5
501         }
502         {
503           \tl_set:Nn #5 {0}
504           \msg_warning:nnxxx
505            { tag }
506            {role-parent-child}
507            { #1 }
508            { #3 }
509            { unknown! }
510         }
511     }
512   \cs_new_protected:Npn \__tag_check_parent_child:nnN #1#2#3
513     {
514       \__tag_check_parent_child:nnnnN {#1}{}{#2}{}#3
515     }
516 }
```

and now the pdf 2.0 version The version with three arguments retrieves the default names space and then calls the full command. Not sure if this will ever be needed but we leave it for now.

```
517 {
518   \cs_new_protected:Npn \__tag_check_parent_child:nnN #1 #2 #3
519     {
520       \prop_get:NnN\g__tag_role_tags_NS_prop {#1}\l__tag_role_tag_namespace_tmpa_tl
521       \prop_get:NnN\g__tag_role_tags_NS_prop {#2}\l__tag_role_tag_namespace_tmpb_tl
522       \str_if_eq:nnT{#2}{MC}{\tl_clear:N \l__tag_role_tag_namespace_tmpb_tl}
523       \bool_lazy_and:nnTF
524         { ! \quark_if_no_value_p:N \l__tag_role_tag_namespace_tmpa_tl }
525         { ! \quark_if_no_value_p:N \l__tag_role_tag_namespace_tmpb_tl }
526         {
527           \__tag_check_parent_child:nVnVN
528             {#1}\l__tag_role_tag_namespace_tmpa_tl
529             {#2}\l__tag_role_tag_namespace_tmpb_tl
530             #3
531         }
532         {
533           \tl_set:Nn #3 {0}
534           \msg_warning:nnxxx
535            { tag }
536            {role-parent-child}
537            { #1 }
538            { #2 }
539            { unknown! }
540         }
541     }
```

and now the real command.

```
542   \cs_new_protected:Npn \__tag_check_parent_child:nnnnN #1 #2 #3 #4 #5 %tag,NS,tag,NS, tl va
543     {
544       \prop_put:Nnn \l__tag_role_debug_prop {parent} {#1/#2}
545       \prop_put:Nnn \l__tag_role_debug_prop {child}  {#3/#4}
```

If the namespace is empty, we assume a standard tag, otherwise we retrieve the rolemapping from the namespace

```
\tl_if_empty:nTF  {#2}
  {
    \tl_set:Nn \l__tag_tmpa_tl {#1}
  }
  {
    \prop_get:cnNTF
       { g__tag_role_NS_#2_prop }
       {#1}
       \l__tag_tmpa_tl
       {
         \tl_set:Nx \l__tag_tmpa_tl {\tl_head:N\l__tag_tmpa_tl}
         \tl_if_empty:NT\l__tag_tmpa_tl
           {
             \tl_set:Nn \l__tag_tmpa_tl {#1}
           }
       }
       {
         \tl_set:Nn \l__tag_tmpa_tl {\q_no_value}
       }
  }
```

and the same for the child If the namespace is empty, we assume a standard tag, otherwise we retrieve the rolemapping from the namespace

```
\tl_if_empty:nTF  {#4}
  {
    \tl_set:Nn \l__tag_tmpb_tl {#3}
  }
  {
    \prop_get:cnNTF
      { g__tag_role_NS_#4_prop }
      {#3}
      \l__tag_tmpb_tl
      {
        \tl_set:Nx \l__tag_tmpb_tl { \tl_head:N\l__tag_tmpb_tl }
        \tl_if_empty:NT\l__tag_tmpb_tl
          {
            \tl_set:Nn \l__tag_tmpb_tl {#3}
          }
      }
      {

## 1.7 Remapping of tags

In some context it can be necessary to remap or replace the tags. That means instead of tag=H1 or tag=section one wants the effect of tag=Span. Or instead of tag=P one wants tag=Code.

The following command provide some general interface for this. The core idea is that before a tag is set it is fed through a function that can change it. We want to be able to chain such functions, so all of them manipulate the same variables.

`\l__tag_role_remap_tag_tl`
`\l__tag_role_remap_NS_tl`

```
\tl_new:N \l__tag_role_remap_tag_tl
\tl_new:N \l__tag_role_remap_NS_tl
```

(*End definition for* `\l__tag_role_remap_tag_tl` *and* `\l__tag_role_remap_NS_tl`.)

`\__tag_role_remap:` This function is used in the structure and the mc code before using a tag. By default it does nothing with the tl vars. Perhaps this should be a hook?

```
\cs_new_protected:Npn \__tag_role_remap: {  }
```

(*End definition for* `\__tag_role_remap:`.)

`\__tag_role_remap_id:` This is copy in case we have to restore the main command.

```
\cs_set_eq:NN \__tag_role_remap_id: \__tag_role_remap:
```

(*End definition for* `\__tag_role_remap_id:`.)

`\__tag_role_remap_inline:` The mapping is meant to "degrade" tags, e.g. if used inside some complex object. The pdf<2.0 code maps the tag to the new role, the pdf 2.0 code only switch the NS.

```
\pdf_version_compare:NnTF < {2.0}
  {
    \cs_new_protected:Npn \__tag_role_remap_inline:

# Part X
# The tagpdf-space module
# Code related to real space chars
# Part of the tagpdf package

interwordspace␣(setup-key) This key allows to activate/deactivate the real space chars if the engine supports it. The allowed values are `true`, `on`, `false`, `off`.

show-spaces␣(setup-key) This key works only with luatex and shows with small red bars where spaces have been inserted. This is only for debugging and is not completly reliable (and change affect other literals and tagging), so it should be used with care.

```
⟨@@=tag⟩
⟨*header⟩
\ProvidesExplPackage {tagpdf-space-code} {2022-08-24} {0.97}
 {part of tagpdf - code related to real space chars}
⟨/header⟩
```

## 1 Code for interword spaces

The code is engine/backend dependant. Basically only pdftex and luatex support real space chars. Most of the code for luatex which uses attributes is in the lua code, here are only the keys.

interwordspace␣(setup-key)
show-spaces␣(setup-key)

```
⟨*package⟩
\keys_define:nn { __tag / setup }
  {
    interwordspace .choices:nn = { true, on }
      { \msg_warning:nnx {tag}{sys-no-interwordspace}{\c_sys_engine_str}  },
    interwordspace .choices:nn = { false, off }
      { \msg_warning:nnx {tag}{sys-no-interwordspace}{\c_sys_engine_str}  },
    interwordspace .default:n = true,
    show-spaces .bool_set:N = \l__tag_showspaces_bool
  }
\sys_if_engine_pdftex:T
  {
    \sys_if_output_pdf:TF
      {
        \pdfglyphtounicode{space}{0020}
        \keys_define:nn { __tag / setup }
          {
            interwordspace .choices:nn = { true, on }  { \pdfinterwordspaceon },
            interwordspace .choices:nn = { false, off }{ \pdfinterwordspaceon },
            interwordspace .default:n = true,
```

```
      show-spaces .bool_set:N = \l__tag_showspaces_bool
    }
  }
  {
    \keys_define:nn { __tag / setup }
    {
      interwordspace .choices:nn = { true, on, false, off }
        { \msg_warning:nnn {tag}{sys-no-interwordspace}{dvi}  },
      interwordspace .default:n = true,
      show-spaces .bool_set:N = \l__tag_showspaces_bool
    }
  }

\sys_if_engine_luatex:T
  {
    \keys_define:nn { __tag / setup }
      {
        interwordspace .choices:nn =
                                  { true, on }
                                  {
                                    \bool_gset_true:N \g__tag_active_space_bool
                                    \lua_now:e{ltx.__tag.func.markspaceon()}
                                  },
        interwordspace .choices:nn =
                                  { false, off }
                                  {
                                   \bool_gset_false:N \g__tag_active_space_bool
                                   \lua_now:e{ltx.__tag.func.markspaceoff()}
                                  },
        interwordspace .default:n = true,
        show-spaces      .choice:,
        show-spaces  / true  .code:n =
                                  {\lua_now:e{ltx.__tag.trace.showspaces=true}},
        show-spaces  / false .code:n =
                                  {\lua_now:e{ltx.__tag.trace.showspaces=nil}},
        show-spaces .default:n = true
      }
  }
```

(*End definition for* `interwordspace (setup-key)` *and* `show-spaces (setup-key)`*. These functions are documented on page* 149.)

`\__tag_fakespace:` For luatex we need a command for the fake space as equivalent of the pdftex primitive.

```
\sys_if_engine_luatex:T
  {
    \cs_new_protected:Nn \__tag_fakespace:
      {
        \group_begin:
        \lua_now:e{ltx.__tag.func.fakespace()}
        \skip_horizontal:n{\c_zero_skip}
        \group_end:
      }
```

```
75    }
76 ⟨/package⟩
```

(*End definition for* `\__tag_fakespace:`.)
